AGRICULTURE, FORESTRY, FISHING & HUNTING
Cop and Animal Production
Foresty and Logging
Fishing, Hunting and Trapping
Support Activities for Agriculture and Foresty

Mining (EXCEPT OIL, AND GAS)
Coal Mining
Metal Ore Mining
Non-Metalite Mineral Mining and Quarrying
Support Activities for Mining and Oil and Gas Extraction MINING AND OIL AND GAS EXTRACTION

UTILITIES

Electric Power Generation, Transmission and Distribution
Natural Gas Distribution, Water and Other Systems
Natural Gas Distribution
Water, Sewage and Other Systems

## MANUFACTURING CONSTRUCTION

Food Manufacturing
Animal Food Manufacturing
Sugar and Confectionory Product Manufacturing
Fruit and Vegeable Preserving and Specially Food Manufacturing
Parity and Vegeable Preserving and Specially Food Manufacturing
Dairy Product Manufacturing and Pashging
Meat Fooder, Manufacturing
Sealton Of Product Preparation and Pashging
Miscellaneous Food Manufacturing
Grain and Olised Milling
Bakeries and Tortila manufacturing
Other Food Manufacturing

Beverage and Tobacco Product Manufacturin; Beverage Manufacturing Tobacco Manufacturing

Textile Mills Fibre, Yarn and Thread Mills Fabric Mills Textile and Fabric Finishing and Fabric Coating Fextile and Textile Product Mills

Fextile Product Mills

Clothing Knitting Mills
Cut and Sew Clothing Manufacturing
Clothing Accessories and Other Clothing Manufacturing Clothing Manufacturing

Leather and Allied Product Manufacturing Footwear Manufacturing Leather and Allied Product Manufacturing (excluding footwear)

Veneer, plywood and engineered wood product Other wood product manufacturing Wood Product Manufacturing Sawmills and Wood Preservation

Paper Manufacturing
Pulp, Paper and Paperboard Mills
Converted Paper Product Manufacturing

Petroleum and Coal Products Manufacturing Printing and Related Support Activities

Basic Chemical Manufacturing
Resis, Synthetic Ribbers, and Antificial and Synthetic Fibres and Filame
Pesticiaes, Fertilizar and Other Agricultural Chemical Manufacturing
Planmaceutical and Medicine Manufacturing
Miscell ancouse Chemical Product Manufacturing
Maint counting and Addistive Manufacturing
Samp and cleaning compound.
Soap and cleaning compound.

Plastics and Rubber Products Manufac Plastic Product Manufacturing

Rubber Product Manufacturing

Non-Metalite Mineral Product Manufacturing
Current and Cheveler Models Manufacturing
Miscellaneous Non-Metal Ponduct Manufacturing
Cap Product and Refuncion Nandatastuning
Class and Class Product Manufacturing
Line and Cypane Product Manufacturing
Line and Cypane Product Manufacturing
Line and Cypane Product Manufacturing
Chev Non-Metallic Mineral Product Manufacturing
Other Non-Metallic Mineral Product Manufacturing

Primary Metal & Fabricated Metal Product Manufac

Primary Meal Manufacturing Iron and Stee Mills and Ferro-Alloy Manufacturing Steel product manufacturing from purchased steel Alumina and aluminum production and processing Non-ferrous metal (except aluminum) production and J

Fubricated Metal Produces Manufacturing
Optory and Sumprivation of Serging and Sumprivation
Cuttory and Hand Tool Manufacturing
Cuttory and Hand Tool Manufacturing
Boilet unka and shipping continuous mundicutring
Boilet unka and shipping continuous mundicutring
Soring and Wire Product Manufacturing
Medius shops, named product, and screw, not and boil manufa
Conting Engraving. Hear Treating and Alited Activities
Other Tabricated Metal Product Manufacturing

Machinery Manufacturing
Ageinlung conservation and mining machinery manufacturing
pageinlung-conservation and mining machinery manufacturing
Industrial Machinery Manufacturing
Commercial and Service Industry, adhibitory Manufacturing
Ventilation, Heating Art-Contintioning and Commercial Refrigeration Equ
Metalworking Machinery Manufacturing
Engine, Turbine and Power Transmission Equipment Manufacturing
Other general purpose machinery manufacturing

Computer and Electronic Product Manufacturing objects and Bellectronic Product Manufacturing Electronic Product Manufacturing Communications equipment manufacturing Semicontactor and Other Electronic Component Manufacturing Manufacturing and Reproducing Magnéte, and Optical Modina Manufacturing and Reproducing Magnéte, and Optical Modina Manufacturing and Reproducing Magnéte, and Optical Modina

Beetrical Equipment Appliance and Component Manufacturi Household Appliance Manufacturing Electrical Equipment and Component Manufacturing Electrical Edging Englishment Manufacturing Electrical equipment manufacturing Other electrical equipment and component manufacturing

Transportation Equipment Manufacturing Moor Vehicle Manufacturing Moor Vehicle Body and Trailer Manufacturing Moor Vehicle Pars Manufacturing Acrospace Product and Parts Manufacturing Ruinoal Rolling Stock Manufacturing Ship and Boat Building Other Transportation Equipment Manufacturing

Furniture and Related Product Manufacturing Household and institutional furniture and kitchen cal Office Furniture (including Fixtures) Manufacturing Other Furniture-Related Product Manufacturing

Miscellaneous Manufacturing Medical Equi pment and Supplies Manufacturing Other miscellaneous manufacturing WHOLESALE TRADE

TRANSPORTATION AND WAREHOUSING
The A Image of the Transportation
Transi and Ground Passonger Transportation
Transi and Ground Passonger Transportation

## SEC INTERROGATORY #31

## INTERROGATORY

Issue 3.1 How should the X factor be determined?

[B/3/1/5] Please advise who prepared Table 2, and provide all raw data behind it. Please advise the period covered. Please confirm that Table 2 shows that Canadian utilities have been significantly less productive than US utilities over the study period. Please confirm that one explanation for that productivity difference is that Canadian utilities have more barriers to achieving productivity improvements than US utilities. Please confirm that another explanation for the productivity differences is that US utilities and regulators have moved more quickly than Canadian utilities and regulators to adopt efficiency measures and thus improve productivity.

## **RESPONSE**

The corrected evidence provides the proper reference for Table 2. This table was referenced from an Industry Canada report entitled, "What Explains the Canada-U.S. TFP Gap".

Please refer to the Industry Canada report entitled, "What Explains the Canada-U.S. TFP Gap" which can be found as an attachment to Exhibit I, Tab 13, Schedule 7, for the authors' discussion on the time period covered.

Table 2 shows that Canadian utilities have achieved less Total Factor Productivity than U.S. utilities over the study period.

Please refer to the Industry Canada report entitled, "What Explains the Canada-U.S. TFP Gap" which can be found as an attachment to Exhibit I, Tab 13, Schedule 7, for the authors' hypotheses of the underlying reasons for the TFP gap.

It is incorrect to conclude that one reason for the productivity differences is that U.S. utilities and regulators have moved more quickly than Canadian utilities and regulators to adopt efficiency measures and thus improve productivity. For one, the sources of TFP gap span much broader than simply the utility sector. For another, neither the utilities nor the regulator can control all of the factors that contribute to productivity growth. Productivity growth is the result of outputs (growth in customers and volumes) and inputs (capital, labour, and non-labour inputs).

#### SEC INTERROGATORY #33

#### **INTERROGATORY**

Issue 3.2 What are the appropriate components of an X factor?

[B/3/1/22] Please provide a new Table in the form of Table 8 for each of the following examples:

- a. \$1 million cost, 10 year life, \$350,000 annual benefit.
- b. \$1 million cost, 5 year life, \$200,000 annual benefit.

Further, please recalculate both Table A, and the two examples above, using the Company's weighted average cost of capital as the discount rate, instead of 10%.

#### **RESPONSE**

The illustration provided at Table 8 was merely that: an illustration. The specific inputs chosen were chosen for simplicity's sake. Of course choosing different input numbers will change the results, however, this doesn't change the fact that, all else equal, including a stretch factor limits the Company's ability to invest in productivity-enhancing projects. This is especially true for a Company whose capital budget is constrained by large special projects and significant capital requirements for safety and integrity projects.

A reproduction of Table 8 with the 2007 WACC and the illustrations requested above are presented in the following tables. The WACC used is 5.984%.

In the reproduction of Table 8 found on page 3 of this exhibit, using the Company's WACC, the projected benefits are positive, both with and without the stretch factor. The Company's share of the benefits is reduced from 5.71% without the stretch factor to 3.20% with the stretch factor, while the customer benefit increases from 94.29% to 96.80%.

In the SEC example (a) found in the table on page 4 of this exhibit, the projected benefits are positive, both with and without the stretch factor. The Company's share of the benefits is reduced from 30.10% without the stretch factor to 25.80% with the stretch factor, while the customer benefit increases from 69.90% to 74.20%.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 33 Page 2 of 4

In the SEC example (b) found in the table on page 4 of this exhibit, the projected benefits are negative, both with and without the stretch factor, indicating no investment should take place. The Company's share of the negative benefits is increased from 100.00% without the stretch factor to 124.67% with the stretch factor. The customer share of the negative benefit decreases from 0.00% without the stretch factor to -24.67% with the stretch factor. In other words, if the project did take place, the Company takes a greater loss so that customers may have the benefit of the stretch factor.

In the end, all this exercise shows is that the numbers are arbitrary. The illustration was intended only to show that, all else equal, the stretch factor only reduces the ability for the Company to invest in productivity-enhancing projects at the margin. This is only exacerbated by the fact that the Company's capital budget is constrained by spending required for large special projects, safety and integrity, reinforcements, relocations, gate station rebuilds, etc.

#### **SEC INTERROGATORY #34**

#### **INTERROGATORY**

Issue 3.2 What are the appropriate components of an X factor?

[B/3/1/23] Please confirm that the result, in the Table 8 example, is that there is a net ratepayer benefit through the 0.46% stretch factor of 3.7% of the capital cost of the project.

#### **RESPONSE**

The effect of the stretch factor, as it is shown in the illustration in Table 8 of the evidence, is to reward customers with 3.7% of the *projected benefits* related to the project at the expense of the Company. Customers also derive 99.64% of the total benefits through the rebasing mechanism for a total share of 103.32% of projected benefits with the inclusion of the stretch factor. This is an illustration of the incentive destroying effects of the stretch factor.

As a percentage of the capital cost, customers would derive 4.68% of the capital cost through the stretch factor and 125.15% of the capital cost through rebasing.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 35 Page 1 of 1

#### **SEC INTERROGATORY #35**

#### INTERROGATORY

Issue 3.2 What are the appropriate components of an X factor?

[B/3/1/23] Please confirm that the effect of eliminating the stretch factor is that ratepayers see no benefit from incentive regulation until 2013 at the earliest, but the shareholder sees a benefit from incentive regulation as early as 2008.

#### **RESPONSE**

The statement above is false. Customers receive the benefit of safe and reliable distribution throughout the IR term and beyond. The shareholder only sees a benefit from incentive regulation if it can find productivity enhancing projects, has the spare capital to invest in these projects, and is willing to bear the inherent risks of the project. Including a stretch factor, all else equal, only limits the capital available to invest in productivity enhancing projects, increases the risk profile of any proposed projects, and puts at risk future customer benefits since projects at the margin may not be undertaken due to the incentive destroying effects of the stretch factor.

On the other hand, the shareholder loses all the benefit at the rebasing period with customers gaining all of the benefit.

Filed: 2007-09-10 EB-2007-0615 Exhibit I Tab 11 Schedule 36 Page 1 of 1

#### **SEC INTERROGATORY #36**

#### **INTERROGATORY**

Issue 3.2 What are the appropriate components of an X factor?

[B/3/1/29] Please provide a numerical comparison, with backup data and explanations, of the ratepayer benefit achieved through Enbridge's targetted PBR, broken down into the benefit provided by the stretch factor, and the benefit provided on rebasing.

#### RESPONSE

This interrogatory is based on the premise that ratepayer benefits are limited to rate savings and that such savings can be measured against a theoretical Cost of Service rate structure. The Company does not accept this premise.

Targeted PBR was in effect for three years, from 2000 to 2002 inclusive. The design of the program allowed Enbridge Gas Distribution to provide safe and reliable gas service to its existing customers while adding approximately 50,000 new customers each year at just and reasonable rates. The benefits to ratepayers were precisely that: safe and reliable service for existing customers and access to natural gas for new customers. It can be argued that new customers benefited more than existing customers since they were able to use natural gas instead of electricity or oil, which provided them with substantial savings in energy costs.

Calculation of a rate saving for existing customers during and after T-PBR would require a construction of a theoretical Cost of Service regime that might have been in place from 2000 to 2002 inclusive, that might have provided ratepayers with different rates. This would require numerous assumptions that the Company is not prepare to undertake.

#### **SEC INTERROGATORY #37**

#### **INTERROGATORY**

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/3/1/34] Please provide a detailed table showing the average age and years of service for Enbridge's employees in each of the last twenty years, broken down by employee category (e.g. executive, managerial, unionized, other, or finer breakdowns if possible). If Enbridge has any forecasts of that same data for future years, please provide those forecasts as well.

#### **RESPONSE**

Please see chart on the next page. Twenty years of data is not possible to recreate as information systems have been replaced within that time period. Data from 1999 is available in aggregate, however historic data is not available to break age/years of service into employee categories prior to 2004.

We are unable to provide future projections of average age and years of service as they will be dependent upon the specific employee base at that time. The Company knows that approximately 38% of current employees will be eligible to retire over the next five years. While they may not elect to retire as soon as they are eligible, it is reasonable to assume that as they leave the Company, they will be replaced with younger employees, thus reducing both average age and average years of service over time.

#### INTERROGATORY

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/3/1/34] Please provide a detailed table showing the average cost per employee for each of pension costs and benefit costs in each of the last twenty years, broken down by employee category (e.g. executive, managerial, unionized, other, or finer breakdowns if possible). If Enbridge has any forecasts of that same data for future years, please provide those forecasts as well.

#### **RESPONSE**

Please see table on the next page. Twenty years of data is not possible to recreate as information systems have been replaced within that time period. Data from 1999 to current date has been provided.

Please note that benefit information cannot be broken down by employee type. We receive notification of usage at the aggregate level from the carrier.

EGD has been precluded from contributing to the Registered Pension Plan since 1999 due to the pension surplus. The pension amounts noted reflect contributions made to the various SERP plans during this period plus costs attributable to pension education and pension planning for our employees.

Actual benefit costs are driven by usage in any given year. While the Company cannot conclusively predict future costs, projections for 2008 to 2010 have been provided, based on assumptions of at least 10% increases year over year for medical/dental, which is in line with projections provided by Mercers in last year's proceeding (Attachment: EB-2006-0034, Exhibit D1, Tab 2, Schedule 2, page 2 of 2, Appendix B) plus a continuation of existing rates for government deductions (EI, CPP, EHT).

#### **2006 Market Inflation Factors (Including Utilization)**

Dear Ron:

Please find attached a table that updates the historical and projected inflation factors (including utilization). The historical and future market trends reflect what Mercer has seen and what we expect to see. This data is mainly based on input from the insurance industry.

The main drivers in the medical area are increased utilization and inflation coupled with an aging workforce and the high cost of new drugs. There is also increased utilization of health care related products and services other then drugs by plan members.

The main drivers in the dental area are utilization and fee guide increases. The provincial Dental Fee Guides are increasing faster than the regular Consumer Price Index. The demand for dental care continues to grow also due to the aggressive marketing by dentists.

Sincerely,

Christine Trembley

nothe Tubley

#### **SEC INTERROGATORY #39**

#### **INTERROGATORY**

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/3/1/33] Please provide a calculation of the expected impact of changes to the Canadian dollar exchange rate on Enbridge's throughput and revenues during the IR period. Please provide any studies, analyses, and other information related to such impacts.

#### **RESPONSE**

The Company has not conducted any studies relating to the expected impact of changes in the Canadian dollar exchange rate on throughput and revenues for General Service Customers during the IR period.

Based on the information that is available to the Company account executives who deal with industrial customers, approximately 30% of the 2008 industrial customer volume forecast will be negatively impacted if Canadian dollar further strengthens compared to the value at the time of the development of budget in early March. With recent years' multiple unfavourable economic or business conditions negatively impacting industrial customers, such as the exchange rate, volatile and high gas prices, global cost pressures, it is difficult for contract market customers to inform the Company's account executives of the exact impact of Canadian dollar exchange rate on consumption. Moreover, it is also not possible to use regression models to estimate the exchange rate's elasticities by customers within the Standard Industrial Classification (SIC) group. The reason is that within the same industry some customers are exporters, some are importers and some are neutral to the exchange rate.

#### **SEC INTERROGATORY #44**

#### INTERROGATORY

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/3/1/33] Please provide details, including source documents if available, of the TSSA's new requirements with respect to pipeline integrity.

#### RESPONSE

The latest TSSA requirements for pipeline integrity are contained in Director's Order FS-087-06, dated August 15, 2006. The document is an Amendment to the Oil and Gas Pipeline Systems Code Adoption Document. It makes many amendments to CSA Z662 as adopted by the TSSA for use in Ontario.

The amendments to section 10.11.2.7 specifically state:

...an operating company shall develop a pipeline integrity management program for steel pipelines with a MOP of 30 % or more of the SMYS.

These pipelines have been identified and are known as Integrity Mains.

The amended section 10.11.2.8 requires:

The implementation of this program based on Annex N must be completed no later than June 30, 2007.

The amendments to section 12.10.11.1.1 state:

Operating companies shall establish effective procedures for managing the integrity of pipeline systems with MOP less than 30 % of SMYS (Distribution Systems) so that they are suitable for continued service.

Amended section 12.10.11.1.4 requires:

The implementation of DSIMP shall be completed no later than April 30, 2008.

DSIMP is defined in amended clause 12.10.11.1.2 as a distribution system integrity management program.

The Director's Order is available on the TSSA's website at www.tssa.org.

#### **SEC INTERROGATORY #45**

#### **INTERROGATORY**

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/3/1/33] Please provide a detailed cost/benefit analysis, including annual impacts, of the introduction of "pigging" into the Company's operations.

#### <u>RESPONSE</u>

The Pipeline Integrity Management Program Manual was developed in 2003 in anticipation of upcoming legislative requirements and was revised in 2006 to meet the requirements of the Director's Order. A 10 Year Baseline Plan to identify, prioritize and complete the required integrity assessments of the Company's Integrity Mains was developed in conjunction with the manual. Work on the baseline integrity assessments of the Integrity Mains began in 2003 and is scheduled for completion in 2013. The manual requires ongoing integrity assessments of the Integrity Mains on an ongoing 10 year basis.

The projected costs to complete the 10 Year Baseline Plan are given in the table below. A cost / benefit analysis has not been completed for the program because it is a mandatory regulatory requirement and that analysis was not necessary to justify it.

Voor	Estimated O&M	Estimated Capital
<u>Year</u>	<u>Cost</u>	<u>Cost</u>
2007	\$650,000	\$3,609,545
2008	\$250,000	\$6,750,000
2009	\$2,180,000	\$5,980,000
2010	\$1,400,000	\$5,775,000
2011	\$1,300,000	\$4,810,000
2012	\$1,270,000	\$5,145,000
2013	\$1,552,044	\$100,000

#### **SEC INTERROGATORY #46**

#### **INTERROGATORY**

Issue 3.3 What are the expected cost and revenue changes during the IR plan that should be taken into account in determining an appropriate X factor?

[B/4/1/10] Please file, in confidence if necessary, copies of any offers, proposals or negotiating documents received by the Company or Enbridge Inc. in the last five years in which any arms length third party signifies their willingness to consider purchasing the shares of Enbridge Gas Distribution for more than their book value.

#### <u>RESPONSE</u>

The Company sees no link between the information requested and Issue 3.3 "expected costs and revenue changes during the IR plan and determination of appropriate X Factor." Therefore, the Company respectfully declines to provide the information even if it existed.

If the Company were to be sold to a third party, this would require bringing an application before the Board. Any studies supporting such an application would be filed at that time.

#### **SEC INTERROGATORY #48**

#### **INTERROGATORY**

Issue 4.1 Is it appropriate to include the impact of changes in average use in the annual adjustment?

[B/1//1/7] Please provide any studies, memos, research, analyses, forecasts, or other documents, physical or electronic, dealing in whole or in part with the reasons for changes in average use for Rate 6 customers, including, without limiting the generality of the foregoing, any documents that calculate or estimate the disaggregated factors driving changes in average use.

#### **RESPONSE**

Consistent with previous rate case filings, the Gas Volume Budget evidence always presents the impact of factors influencing the changes in Rate 6 average uses along with reasons. Please refer to Tables 3-5 at Exhibit C, Tab 2, Schedule 1 for factors influencing the change in Rate 6 apartment, commercial and industrial gas consumption between 2008 Test Year Budget and 2007 Bridge Year Estimate. Appendix A of Exhibit C, Tab 2, Schedule 1 provides further rate class detail and explanation for Test Year, Bridge Year, and Historical Year Rate 6 gas volumes and related items.

#### **SEC INTERROGATORY #50**

#### INTERROGATORY

Issue 4.1 Is it appropriate to include the impact of changes in average use in the annual adjustment?

[B/1/1/8] Please provide support, including forecasts, for the statement "residential average use during the next five years will decline more than the historical trend, all other things being equal".

#### RESPONSE

The Company has been attaching approximately 40,000 new construction customers per year for the past ten years and expects to continue adding new construction customers at similar levels. New building code requirements being implemented by the housing industry for 2007, 2009 and 2012 as highlighted in Exhibit C, Tab 2, Schedule 1, Pages 7 to 8 will result in increasingly more energy efficient homes which are expected to reduce average use in the next five years by more than the historical trend, all else being equal. This is one of the factors why the Company believes that revenue cap proposal is preferred to the price cap in achieving fair and reasonable rates for all stakeholders by assuring each year's volume budget has incorporated the latest actual and best known information.

#### **SEC INTERROGATORY #53**

### INTERROGATORY

Issue 4.1 Is it appropriate to include the impact of changes in average use in the annual adjustment?

[B/1/1/9] Please provide a table in the same format as Table 1 using actual rather than Board-approved figures, and thus leaving out 2007.

#### RESPONSE

Tables 1 to 6 on the following pages provide a table in the same format as Table 1 using weather normalized actual at Exhibit B, Tab 1, Schedule 1, page 9 for each rate class.

Witnesses: I. Chan

T. Ladanyi A. Kacicnik

## **SEC INTERROGATORY #55**

## **INTERROGATORY**

Issue 5.1 What are the Y factors that should be included in the IR plan?

[B/4/1/2 and 5] Please confirm that, on average, Enbridge's capital expenditure related to a customer attachment has been about \$2,000. Please confirm that current customer adds cost about \$2,500 each in capital expenditures.

#### RESPONSE

With respect to the capital cost per customer addition please see Item numbers 5 and 6 of Table 1: Comparison of Gross Customer Additions and Average Cost per Customer Addition in the response in CCC Interrogatory #3 found at Exhibit I, Tab 3, Schedule 3.

Witnesses: S. Kancharla

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 56 Page 1 of 1

### **SEC INTERROGATORY #56**

#### **INTERROGATORY**

Issue 5.1 What are the Y factors that should be included in the IR plan?

[B/4/1/5] Please confirm the following financial parameters relating to a current residential customer attachment (all on a full-year basis):

a. Capital expenditure: \$2,500
b. Incremental O&M: \$70
c. Incremental revenue: \$325
d. Incremental depreciation: \$60
e. Incremental cost of debt: \$100

f. Incremental cost of equity: \$75

g. Incremental tax cost: negative in the first three years, positive in subsequent years

## **RESPONSE**

Please refer to the appendix attached to Board Staff Interrogatory #17 at Exhibit I, Tab 1, Schedule 17.

Witnesses: K. Culbert

J. Denomy S. Kancharla T. Ladanyi

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 57 Page 1 of 1

## **SEC INTERROGATORY #57**

## **INTERROGATORY**

Issue 5.1 What are the Y factors that should be included in the IR plan?

[B/4/1/5] Please provide similar financial parameters to those in the last question, but applicable to an average Rate 6 attachment.

#### **RESPONSE**

Please refer to School Energy Coalition Interrogatory #9 at Exhibit I, Tab 11, Schedule 9.

Witnesses: K. Culbert

J. Denomy S. Kancharla T. Ladanyi

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 58 Page 1 of 1

#### **SEC INTERROGATORY #58**

#### **INTERROGATORY**

Issue 5.1 What are the Y factors that should be included in the IR plan?

[B/4/1/11] Please show the calculation of the figure \$1.5 billion. Please identify specifically the impact in that calculation of the Company's annual depreciation charge and any other non-cash items affecting the amounts to be sought from investors. Please file any capital investment plans, proposals, analyses, or similar documents of Enbridge Inc. or Enbridge Gas Distribution for any period that includes any of 2008-2012 and that refer to uses of capital within Enbridge Gas Distribution.

## **RESPONSE**

The figure of \$1.5 billion is to illustrate the approximate levels of capital investment over the IR plan period based on an approximate level of \$300 million per year. That number of \$300 million per year may be affected by the nature of the IR model and the timing of its implementation following the release of the EB-2007-0615 Decision. The model adopted by the Ontario Energy Board may have incentives or disincentives for capital investment which may affect the Company's ability to invest. The Company does not have a forecast of capital investments for years 2009 to 2012.

Witness: S. Kancharla

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 59 Page 1 of 1

### **SEC INTERROGATORY #59**

#### INTERROGATORY

Issue 5.1 What are the Y factors that should be included in the IR plan?

[B/4/1/13-15] Please take the Board-approved capital budget of Enbridge for each of the last ten years and create a table dividing up those budgets between those capital expenditure categories that the Company is proposing should have Y factor treatment, and those categories that would be covered by the X factor. Please prepare a similar table using actuals instead of budgets.

## **RESPONSE**

Please refer to the table below.

#### **SEC INTERROGATORY #60**

#### **INTERROGATORY**

Issue 6.1 What are the criteria for establishing Z factors that should be included in the IR plan?

[B/1/1/18] Using the utility's proposed criteria for Z factors, please advise whether each of the following hypotheticals would, in Enbridge's opinion, qualify for Z factor treatment:

- a. The NEB approves an ROE formula for TCPL that includes a "flotation factor" of 150 basis points instead of 50 basis points, as is used in Ontario.
- b. The OEB approves an ROE formula for electricity utilities for 3<sup>rd</sup> generation IRM that reduces their resulting ROE, relative to the ROE applicable to gas utilities, by 100 basis points.
- c. The federal government reduces the corporate income tax rate by 4%.
- d. The Ontario government reduces the corporate income tax rate by 4%.
- e. GAAP is changed to require expensing of the undepreciated capital cost of an asset as soon as it is known that it will be taken out of service within five years.
- f. The Ontario government increases the minimum wage to \$12, and that has a ripple effect in wages at all levels throughout the province.
- g. Increased uncertainty in the Ontario electricity generation sector due to changes in government policy leads to material changes in the level of gas-fired merchant generation planned in the Enbridge franchise area.
- h. A gas-fired air conditioner that is competitive with electric heat pumps is invented and available commercially in Ontario.
- i. The Ontario government bans the sale of mid-efficiency furnaces to reduce greenhouse gas emissions.
- j. A fire of unknown origin destroys the head office building of the utility, and some of the loss is not covered by insurance.
- k. The utility is sued by third parties for breach of contract, and receives a

Witnesses: R. Campbell

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 60 Page 2 of 2

judgment against it that is not covered by insurance.

- I. A change the Labour Relations Act allows the Company's union to claim an extra day off per year per unionized employee.
- m. The utility suffers additional losses in its pension plan, and is ordered by the pension plan's regulator to make top-up payments into the plan.
- n. The utility incurs additional costs because of an expansion of Sarbanes-Oxley type rules to apply to Ontario companies.

#### **RESPONSE**

The Company has proposed the general criteria guiding the Board in its determination on recoverability at CCC #29 at Exhibit I, Tab 3, Schedule 29. The following responses to hypothetical scenarios are based upon the information provided in each example. The final determination of whether a scenario would quality as a factor would depend upon the actual facts in each case and the application of the criteria defined at CCC #29 at Exhibit I, Tab 3, Schedule 29. Given this background, the Company provides the following responses to the hypothetical scenarios proposed.

- a. No.
- b. No.
- c. No.
- d. No.
- e. Yes
- f. No.
- g. No.
- h. No.
- i. No.
- j. Yes.
- k. Whether the costs related to the matter described in subsection (k) of this question would be recoverable as a z-factor would depend upon the specific facts of that case that the Company would bring forward to the Board at the appropriate time. The Company proposes that the general criteria guiding the Board in its determination on recoverability are set out in CCC #29 at Exhibit I, Tab 3, Schedule 29. Any costs that meet these criteria, as determined by the Board, would be recoverable as a z-factor.
- I. No.
- m. No.
- n. No.

Witnesses: R. Campbell

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 62 Page 1 of 1

#### **SEC INTERROGATORY #62**

#### INTERROGATORY

Issue 7.1 How should the impact of the NGEIR decisions, if any, be reflected in rates during the IR plan?

Please confirm that the overall impact of the NGEIR Decision dated November 7, 2006 was expected to be a net benefit to Enbridge ratepayers. Please provide a breakdown of how Enbridge proposes to reflect that net benefit in rates during the IR period. If Enbridge is not expecting the NGEIR decision to provide net benefits to its ratepayers during the IR period, please provide an explanation, and quantify any net cost of the NGEIR decision to Enbridge ratepayers, broken down by rate class and by year.

#### **RESPONSE**

The Natural Gas Electricity Interface Review ("NGEIR") generic proceeding was initiated by the Ontario Energy Board and concluded in August 2006. Through NGEIR the Board approved new unbundled distribution and storage service for gas fired power generation and other large volume customers and made a number of decisions regarding storage regulation in the province of Ontario. Large volume customers now have a choice between bundled and unbundled services. In the Company's view, the Board's decision with respect to storage regulation will stimulate further storage development in Ontario.

Witnesses: P. Hoey

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 63 Page 1 of 1

#### **SEC INTERROGATORY #63**

#### **INTERROGATORY**

Issue 8.1 What is the appropriate plan term for each utility?

[B/1/1/18] Please advise whether Enbridge would be comfortable with a plan term longer than five years, such as ten years. Please advise what changes, if any, would have to be made to Enbridge's application to make a ten year IR period acceptable to Enbridge.

#### RESPONSE

The Company believes that the best way to consider a term longer than 5 years is to review an existing approved plan, as the Company proposes, to determine if there is stakeholder support for an extension to or renewal of the plan.

Witnesses: R. Campbell

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 64 Page 1 of 1

### **SEC INTERROGATORY #64**

#### **INTERROGATORY**

Issue 8.1 What is the appropriate plan term for each utility?

[B/1/1/18] Please advise whether, in planning during an IR period, the term of the plan is a material consideration in deciding the timing of efficiency investments within the IR period. By way of example, is it reasonable to expect a utility to focus efficiency investments in the first year or two of the plan, in order to maximize the time the shareholder has to reap the rewards, but reduce efficiency investments in the later years since the benefits will be more limited?

### **RESPONSE**

The term of the plan would be a material consideration. In addition, the expectation of rebasing, as compared with a continuation of incentive regulation, would also impact the utility's incentive to pursue productivity improvement.

Witnesses: R. Campbell

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 67 Page 1 of 1

#### **SEC INTERROGATORY #67**

#### **INTERROGATORY**

Issue 10.1 Should an ESM be included in the IR plan?

[B/3/1/1] Please advise how the lack of a stretch factor, and deferral of ratepayer benefits until rebasing, is consistent with the following statement at page 3 the Natural Gas Forum report:

"The Board does not intend for earnings sharing mechanisms to form part of IR plans. The Board views the retention of earnings by a utility within the term of an IR plan to be a strong incentive for the utility to achieve sustainable efficiencies. The Board will ensure that the benefits of the efficiencies are shared with customers through the annual adjustment mechanism and through rebasing.' [emphasis added]

#### **RESPONSE**

The Board states at page 3 of the Natural Gas Forum Decision,

In a multi-year IR plan, the annual adjustment mechanism embodies the combined assessment of cost changes and productivity improvements. The Board concludes that making an appropriate determination of this component will ensure that the benefits of efficiencies are shared with customers during the term of the plan. The Board will determine the methodology for the annual adjustment mechanism through a generic hearing.

The Board has not to this point committed one way or another to the use of a stretch factor. It is the appropriate factors to represent cost changes and productivity changes that ensure customers share in the benefits of the plan. The factor used to represent productivity is composed of multiple components (productivity differential, input price differential, stretch factor). The Company's position is that a stretch factor, all else equal, cannot result in an appropriate factor used to represent productivity.

#### **SEC INTERROGATORY #68**

#### **INTERROGATORY**

Issue 11.1 What information should the Board consider and stakeholders be provided with during the IR plan?

[B/6/1/1] Please provide a summary of the utility's annual corporate budgeting process, including major steps, responsibilities, information available at each step, and the actual dates of each step in 2007. Please include a description of how the utility's budget process is related to, or integrates with, the budgeting of some or all of the other members of the parent company's corporate group.

#### **RESPONSE**

The annual corporate budget process generally follows a similar process each year. The end to end process is kicked-off with the budget guidelines and instructions memo and culminates in the budget approval by the Board of Directors. The key activities and dates for the 2008 Corporate Budget process, which is currently in progress are outlined in the table below. The timing of the key budget activities are geared towards having an approved corporate budget prior to the start of the budget fiscal year.

2008 Corporate Budget Schedule

Key Components	Key Dates <sup>1</sup>
Issue Budget Guidelines & Instructions	Jun-14
Customer Additions	Jul-20
Collect Budget Input (O&M, Capital & Other Revenues)	Jul-4 - Jul-25
Volume Forecast	March - June
Budget Reviews	ongoing through to Aug 31
Financing Plan and Costs	Aug-20
Final O&M and Capital	Sep-14
Final Budget	Sep-19
Budget Approval by Executive Management Team	Sep-24
Submit Budget to Corporate for El Consolidation	Oct-1
El Board of Directors Review	Dec-4
EGD Board of Directors Approval	Jan 2008

#### Notes:

1. Futures dates are tentative.

Witness: T. Ladanyi

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 68 Page 2 of 3

#### Issue Budget Guidelines and Instructions

The Budgets and Financial Analysis department distributes detailed budget instructions with the key strategic objectives and economic and market assumptions to all departments within the Company to ensure consistency in budgets across the Company.

#### **Customer Additions**

The customer additions forecast involves both an economic and regional input. The Planning and Economics department first completes the customer additions forecast based on econometric inputs. This forecast is then validated by Regional Operations for regional specific inputs. The final forecast is consolidated and distributed by the Scorecard and Capital Appropriations department to the appropriate departments.

### Collect Budget Input (O&M, Capital & Other Revenues)

The Budgets and Financial Analysis departments collects O&M, capital expenditures, and other revenues from all departments through the Company's budgeting tool.

#### Volume Forecast

The volume forecast is completed by the Margin Budgets and Accounting department with contract volumes inputs from the Strategic and Key Accounts department; average use forecast from the Planning and Economics department; conservation inputs from the Planning & Opportunity Development department; and customer additions from the Scorecard and Capital Appropriations department.

#### Budget Reviews

Budgets are intensively reviewed across many different management levels. The managers within each department review budget information that is provided to the Finance department, such as the volume forecast, other revenues, O&M and capital expenditure budgets. Department managers review budgets with their respective Executive Management Team ("EMT") member. Representation from the Finance department reviews each department's budget with the respective EMT member and representation from their department.

Witness: T. Ladanyi

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 68 Page 3 of 3

## Financing Plans and Costs

Treasury provides financing assumptions, interest rates and exchange rates forecasts to the Budgets and Financial Analysis department.

#### Final O&M and Capital

The O&M and capital budgets are finalized following the outcome of budget review meetings. The final O&M and capital budgets are consolidated by the Budgets and Financial Analysis department for input into the consolidated corporate budget.

#### Final Budget

The Budgets and Financial Analysis department reviews and consolidates all budget inputs, such as O&M, capital expenditures, revenues, gas costs, taxes etc. and prepares corporate financial statements for presentation to the EMT for review and approval.

#### Budget Approval by Executive Management Team

Upon consolidation of the final budget, the EMT along with representation from the Finance department performs a consolidated review of the budget.

#### Submit Budget to Corporate for El Consolidation

The approved budgets are then submitted to the corporate office for consolidation of all Enbridge Inc. business units.

#### El Board of Directors Review

Senior management from the corporate office and Enbridge Gas Distribution present the consolidated Enbridge Inc. budget to the Enbridge Inc. Board of Directors for review and final approval.

#### **EGD** Board of Directors Review

Senior management from Enbridge Gas Distribution presents the Enbridge Gas Distribution budget to the Enbridge Gas Distribution Board of Directors for review and final approval. The timing of this meeting is based on the Board of Directors' meeting schedule, and is typically mid-January.

Witness: T. Ladanyi

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 69 Page 1 of 1

### **SEC INTERROGATORY #69**

#### **INTERROGATORY**

Issue 11.3 What should be the process and the role of the Board and stakeholders?

[B/6/1/3] Please confirm that the Company is not proposing to make its ARC, GDAR, RRR or Undertakings reports publicly available to stakeholders during the IR period. Assuming that is the case, please advise what use, if any, Enbridge proposes that the Board put to those reports in the context of the IR plan, and what role Enbridge proposes that ratepayers and other stakeholders should play in that process?

#### **RESPONSE**

The reporting requirements referenced are those required by the Board. Enbridge assumes that the Board has its own reasons for such reporting and makes appropriate use of such reporting.

Witnesses: R. Campbell

K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 72 Page 1 of 1

#### **SEC INTERROGATORY #72**

#### **INTERROGATORY**

Issue 12.3 Changes in rate design

[B/6/1/2] Please confirm that Enbridge's proposal for flexibility to re-design any existing rates would include an application to the Board, supporting evidence including customer impacts, an opportunity for ratepayers and other stakeholders to ask interrogatories and participate fully in the application, and a hearing (oral or written) for the Board to determine the issues.

#### **RESPONSE**

Confirmed. If the rate-related changes are minor in nature and customer impacts are minimal, the Company is proposing that the Board approval process be included as part of the annual rate setting filing. However, if the rate-related changes are significant and warrant a longer review period, the Company is proposing to file a separate rate change application. This approach reflects the Board Staff's recommendation in its Discussion Paper (page 20).

Witnesses: P. Hoey
A. Kacicnik

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 73 Page 1 of 1

### **SEC INTERROGATORY #73**

#### **INTERROGATORY**

Issue 12.3 Changes in rate design

[B/6/1/2] Please provide Enbridge's current plan, if any, for changes to the fixed charges (for each rate class that would be affected), including the forecast rates for each of the years 2008 through 2012, and the forecast customer bill impacts for each such year for each class and sample customer normally used in such forecasts.

#### RESPONSE

Please refer to the Company's response to Board Staff's interrogatory # 25 found at Exhibit I, Tab 1, Schedule 25 regarding changes to fixed component of distribution rates.

Witnesses: P. Hoey

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 74 Page 1 of 1

#### **SEC INTERROGATORY #74**

#### **INTERROGATORY**

Issue 12.3 Changes in rate design

[B/6/1/2] Please confirm that Enbridge is proposing to be allowed to seek changes in rate design that, while revenue neutral to Enbridge, are not revenue neutral within classes, and are not bill neutral to individual customers. Please describe in detail the factors Enbridge believes the Board should take into account in considering whether to re-distribute Enbridge's revenue requirement between customer classes, or between customer categories, during the IR period. In what ways, if any, should those considerations be different during an IR period than they would be in an annual cost of service proceeding?

## **RESPONSE**

The Company would expect that rate design considerations under incentive regulation would be similar to rate design considerations under cost of service regulation.

Witnesses: P. Hoey

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 75 Page 1 of 1

#### **SEC INTERROGATORY #75**

#### **INTERROGATORY**

Issue 12.3 Changes in rate design

[B/6/1/2] Please provide all studies, analyses, plans, forecasts, and other documents, physical or electronic, related to intended, expected or proposed changes in rate design during any of the years 2008 through 2012, including but not limited to any impact analyses of such changes.

#### RESPONSE

Please refer to the Company's response to Coral Energy Interrogatory #1 at Exhibit I, Tab 15, Schedule 1.

Witnesses: P. Hoey

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 76 Page 1 of 1

#### **SEC INTERROGATORY #76**

#### INTERROGATORY

Issue 12.4 Non-energy services.

[B/6/1/2] Please confirm that Enbridge would, under its proposal, be limited to changes in miscellaneous and non-energy service charges that are revenue neutral. If not, please advise the criteria under which Enbridge would be allowed to increase its overall revenue through these charges. Please confirm that Enbridge is proposing such changes in rates would be without stakeholder involvement, and that under Enbridge's proposal there is no requirement for compliance with the Statutory Powers Procedure Act.

## **RESPONSE**

Enbridge Gas Distribution cannot confirm any of the questions asked above. As outlined in the pre-filed evidence at Exhibit B, Tab 6, Schedule 1, page 3, the Company agrees with the Board Staff that miscellaneous and non-energy services should be outside of the IR plan. The Company is proposing to seek approval for the changes and provide the Board with supporting evidence. However, given these are miscellaneous and non-energy services and outside the IR plan, the Company expects that there would be no requirement for an extensive review or a formal hearing. In the Company's view, resource requirements, a long timeline associated with, and the cost of, a formal hearing would be incompatible with the size or nature of the approvals required.

Witnesses: P. Hoey

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 78 Page 1 of 1

#### **SEC INTERROGATORY #78**

#### **INTERROGATORY**

Issue 14.1 Are there adjustments that should be made to base year revenue requirements and/or rates?

Please advise whether Enbridge has looked at the tax impacts of changing its corporate structure (for example, to that of an income trust or a partnership) during any period that would include any IR period. If so, please provide copies of any plans, forecasts, internal proposals, or other documents related to any such potential change in corporate structure.

#### **RESPONSE**

Similar to many Canadian corporations, Enbridge Gas Distribution has looked at the tax impacts of changing its corporate structure to that of an income trust or a limited partnership. This work was done several years ago and it was decided not to pursue any such changes in the corporate structure. Due to the new legislation covering income trusts, the Company is unlikely to consider any such changes during the IR Plan. However, if the Company were to initiate a change in its corporate structure to an income trust or a limited partnership, it would bring an application before the Board. Any studies supporting such an application would be filed at that time. Since the Company is not requesting approval of any change in its corporate structure in this proceeding, and is not contemplating any such change during the IR term, the Company declines to file any documents dealing with this matter.

Witnesses: P. Hoey

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 79 Page 1 of 1

#### **SEC INTERROGATORY #79**

#### INTERROGATORY

Issue 14.1 Are there adjustments that should be made to base year revenue requirements and/or rates?

Please provide a detailed breakdown of the expected opening rate base for Enbridge on January 1, 2008, by asset category, together with the depreciation and cost of capital amounts that would result from that rate base (without accounting for any additions) during the years 2008 through 2012 inclusive. Please include a continuity chart showing the opening rate base in each subsequent year, by asset category. Please break down the annual costs by rate class using the current cost allocation percentages for 2007.

#### **RESPONSE**

The mechanism which the Board has indicated it intends to implement for 2008 and beyond is a multi-year incentive ratemaking framework. Such a ratemaking mechanism does not require a forecast of rate base, depreciation and cost of capital for the years upon which the mechanism will establish rates.

Further, the request of an expected or forecast opening rate base for January 1, 2008, seems to suggest the potential of an adjustment to base rates to reflect changes in revenue requirement which occurs when comparing such a forecast opening rate base to the Board Approved opening 2008 rate base inherent in the 2007 Decision. It is the Company's understanding that 2007 approved rates would be the base for incentive regulation and the Company has filed on this basis.

The information as requested appears to suggest that the Board should rely on the latest estimate of 2008 opening rate base compared to its approval of a previous forecast of 2008 opening rate base to adjust rates on a go forward basis within an incentive regulation term.

As 2007 approved rates and embedded depreciation and cost of capital were approved on an average of averages forecast of rate base related monthly balances and not on forecast year end rate base balances, the information requested is irrelevant. The Company therefore will not utilize the time and effort of resources required to complete and provide the chart requested.

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 80 Page 1 of 1

#### **SEC INTERROGATORY #80**

#### INTERROGATORY

Issue 14.1 Are there adjustments that should be made to base year revenue requirements and/or rates?

Please restate the breakdowns, result, and continuity chart in the last question, but for each of the years 2008 through 2012 adding capital expenditures in each asset category equal to the average actual (with 2007 as forecast) capital expenditures in each such category for the years 2003 – 2007 inclusive.

## **RESPONSE**

Please see the response to SEC Interrogatory #79 at Exhibit I, Schedule 11, Tab 79.

Witnesses: K. Culbert

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 81 Page 1 of 1

### **SEC INTERROGATORY #81**

#### **INTERROGATORY**

Issue: CIS/Customer Care Application.

[[O/2/1/7] Please describe in detail each time in the last ten years that the Company claimed CCA at levels less than the maximum allowed under the Income Tax Act.

## <u>RESPONSE</u>

The Company has not claimed CCA at a level less than the maximum allowable in any of the past ten years in determining taxable income. The tax planning requirements of the Company during the life of the CIS asset and as a result of the Board's final rate impact determination of the CIS asset are not equatable to past tax planning and CCA claim practices.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 82 Page 1 of 1

#### **SEC INTERROGATORY #82**

## <u>INTERROGATORY</u>

Issue: CIS/Customer Care Application.

[O/2/1/9] Please confirm that the Template is structured to calculate the annual cost of service impact of customer care costs, add up the total, and then smooth those costs over the period 2007 to 2012 inclusive.

#### **RESPONSE**

The overall customer care and CIS settlement template is structured in the above fashion. However, the CIS revenue requirement component of the template has its own smoothing approach embedded within the overall smoothing structure. The results of a different CIS revenue requirement smoothing approach, as the Company was free to request as per the wording of the settlement agreement, would simply replace the CIS capital cost amounts for the years 2009 through 2012 within the settlement template but would not change the structure of the template smoothing approach over the 2007 through 2012 period.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 83 Page 1 of 1

## **SEC INTERROGATORY #83**

## <u>INTERROGATORY</u>

Issue: CIS/Customer Care Application.

[O/2/1/9] Please advise whether the Company is prepared to smooth all CIS and customer care costs over the period to and including the end of life of the new CIS. If the answer is no, please explain why the CIS has to be smoothed over the entire life, but all other customer care costs should not.

### **RESPONSE**

As all stakeholders are likely to be aware, the Company has an agreement for the customer care cost component of this issue through the end of 2012. While the CIS asset forecast values and recoverable amounts have been agreed upon by all parties through the end of 2018, the customer care cost component from 2013 through 2018 is unknown.

Therefore customer care costs cannot be smoothed to the end of the CIS asset life. The Company explained the rationale for the smoothing of the CIS asset revenue requirement over its life in evidence at Exhibit O, Tab 2, Schedule 1.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 84 Page 1 of 1

### **SEC INTERROGATORY #84**

#### **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/1/11] Please show using actual forecasted annual costs that, under the Template as currently structured, there will be a \$9.9 million rate increase in 2013.

#### RESPONSE

The evidence at Exhibit O, Tab 2, Schedule 3, page 1 of 5, line number 16 shows the \$9.9 million increase in rates that will occur in 2013 as a result of the treatment of the CIS revenue requirement within the template as it is currently structured.

The reasons for this required increase in rates was explained in the evidence as referenced in this interrogatory.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 85 Page 1 of 1

#### **SEC INTERROGATORY #85**

#### **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/1/12] Please confirm that "intergenerational unfairness" arises in every circumstance in which flow-through tax accounting, in the form mandated by the Board, is used.

#### **RESPONSE**

As stated in evidence at Exhibit O, Tab 2, Schedule 1, page 9, paragraph 25, in this instance this is not purely an issue about flow through tax accounting. Parties to the customer care / CIS consultative process have already recognized a smoothing approach for the CIS asset revenue requirement which represents a departure from the usual "flow through" tax accounting approach in the form mandated by the Board.

The issue is about the length of the period over which the smoothing should occur and which customers should benefit from the recognition.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 86 Page 1 of 1

#### **SEC INTERROGATORY #86**

#### **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/1/12] Please confirm that the problem of a rate increase after a significant IT expenditure arises during cost of service as well. Please confirm that, if the costs of CIS and Customer Care are as projected in O/2/4/1, then under annual cost of service there would be a \$30 million rate increase from 2010 to 2011, which is instead smoothed under the Template. Please provide details of any past IT project during cost of service in which the Company has proposed smoothing of the rate impacts rather than the traditional tax flow-through approach.

#### **RESPONSE**

Where an IT project of a similar significant expenditure level as that of the CIS asset occurs within a cost of service environment there would be a similar rate increase issue.

If the CIS asset costs are as projected and cost of service regulation was the manner in which rates were being derived, there would be an associated required rate increase from 2010 to 2011 of approximately \$30 million.

While such a cost of service related increase is being smoothed under the template, the smoothing approach currently employed results in customers during the first four years of the CIS assets service life incurring \$11.5 million per year of rate responsibility while customers during the final six years incur \$21.5 million per year of rate responsibility.

There are no past IT projects where a smoothing approach was taken.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 87 Page 1 of 1

## **SEC INTERROGATORY #87**

## **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/1/13] Please confirm that, at the time of rebasing, it is expected that the Company will have achieved efficiencies that, but for the CIS impact, would allow rates to move downward in 2013, producing a ratepayer benefit on rebasing.

## **RESPONSE**

The Company cannot confirm any such expectation.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 88 Page 1 of 1

# **SEC INTERROGATORY #88**

## **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/1/13] Please calculate the earnings impacts in note 12 for Options 2 and 3 as well

# <u>RESPONSE</u>

Under the proposed Option 2 there would be no forecast earnings impact as the Company's forecast of income tax CCA deductions is over the entire ten year service life of the asset.

Under Option 3, there would be forecast positive net earnings impacts after taxes of approximately \$10.6 million and \$14.6 million in the years 2009 and 2010 and negative net earnings impacts after taxes of \$(5.3) million and \$(4.7) million in each of 2011 and 2012.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 91 Page 1 of 1

# **SEC INTERROGATORY #91**

## **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/2-4] Please provide Schedules 2, 3 and 4 in Excel format, with all formulae intact.

# RESPONSE

The Company declines to provide an electronic version of the schedules in live format as it is considered proprietary intellectual property. An electronic version of these schedules requires and is linked to various other working and information files which contain data and calculations. The use of all of these files in determining and understanding revenue requirement results requires specific knowledge and expertise.

The Company will not provide electronic working versions of all of the files required to appropriately calculate revenue requirements for all of the reasons stated above.

Witnesses: K. Culbert

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 11 Schedule 92 Page 1 of 1

# **SEC INTERROGATORY #92**

## **INTERROGATORY**

Issue: CIS/Customer Care Application.

[O/2/4] Please recalculate all three options replacing the figures for each year in line 10 with the most recent annual estimates of those costs, based on the bids received by the Company.

# **RESPONSE**

Exhibit O, Tab 2, Schedule 4, line 10 contains the customer care new service provider contract costs. The CIS asset revenue requirement amount and period of recovery at issue is not impacted by amounts contained within the Exhibit O, Tab 2, Schedule 4, line 10 as referenced.

Witnesses: K. Culbert

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 11 Schedule 93 Page 1 of 1

#### **SEC INTERROGATORY #93**

# **INTERROGATORY**

Issue: CIS/Customer Care Application.

Please advise whether Enbridge has any intention or expectation of implementing any other major IT software or hardware project having a total capital cost in excess of \$10 million after 2007 and prior to 2018. If so, please provide copies of any plans, forecasts, internal proposals, or other documents relating to those intentions or expections, or the impacts (including tax impacts) thereof.

## **RESPONS**

Enbridge Gas Distribution has not produced a comprehensive 10-year IT plan. Aside from the CIS/Customer Care Application, there are no plans in the work for any single system replacement project in excess of \$10 million and the Company does not expect any IT projects greater than \$10+million IT project over the next three years.

Historically, IT applications have a 7 to 10 year lifespan, and therefore, it is fair to assume that Enbridge Gas Distribution will be looking at replacing some or all of its major applications, such as financial systems, contract management systems, meter management systems and work management systems during the 2010 to 2018 time frame. Due to rapid changes in technology as well as IT industry as a whole, the Company can not provide meaningful cost estimates so far in the future.

#### TRANSCANADA ENERGY INTERROGATORY #1

# **INTERROGATORY**

Reference: Enbridge Gas Distribution, Exhibit B, Tab 1, Schedule 1.

Issue 12: Rate-Setting Process

- (a) Under the Revenue Cap Proposal, please explain how EGD would adjust existing rates to determine rates effective January 1, 2008. Please provide and explain any difference in methodology between rate classes.
- (b) Under the Revenue Cap Proposal, please describe what information EGD would provide and the methodology for determining rates, by rate class, effective January 1, 2009 and the remaining years of the Incentive Ratemaking term.
- (c) Please explain the effect on Rate 125 if the number of EGD residential customers were to increase by 50,000. Please exclude the effects of other escalators (GDPPI, X, Y, Z).
- (d) Is it EGD's intent to adjust Rate 125 and other large volume customer rates if the number of residential customers increases? i.e. Does an increase in the number of residential customers cause an increase in Rate 125, all other factors held constant?
- (e) Is it EGD's proposal to calculate its 2008 revenue requirement by increasing its 2007 revenue requirement by 2.01% plus the percentage increase in customers in 2008 compared to 2007 plus changes resulting from the application of Y and Z factors? If not, please explain.

#### **RESPONSE**

- a) Please refer to Board Staff Interrogatory #1 at Exhibit I, Tab 1, Schedule 1.
- b) Please see Enbridge Gas Distribution's pre-filed evidence at Exhibit B, Tab 6, Schedule 1.
- c) Please refer to Board Staff Interrogatory #1 at Exhibit I, Tab 1, Schedule 1.
- d) Please see responses to questions a) and c).

# VECC INTERROGATORY #1

# **INTERROGATORY**

Reference: Reference-Exhibit B, Tab1, Schedule 1 page 11-12 Paras 26-31 Issue 1.2: What is the method for incentive regulation that the Board should approve for each utility?

- a) EGD has outlined why a Revenue Cap Index (RCI) is appropriate for EGD. Provide more details than provided on why a Price Cap Index (PCI) would NOT work, if the PCI formula had additional features such as a Y factor for changes in customer growth/volumes. In other words what features/additions would allow EGD to accept a PCI of the type proposed for Union Gas?
- b) Does EGD accept that there is considerable regulatory burden associated with the annual review under an RCI. Please compare the process and time/stakeholder engagement under an RCI and PCI.

# <u>RESPONSE</u>

- a) The Company believes that its revenue per customer cap provides the best solution, given the expressed objectives for incentive regulation and the circumstances the Company faces, in particular declining average use and pressures for new customer attachment. The Company believes that any attempt to modify a price cap to attempt to give it the characteristics of a revenue cap is not appropriate.
- b) There is more regulatory process associated with the Company's proposal, as compared to a price cap index, since the Company's proposal contemplates an annual submission and review with respect to volume and customer number forecasts.

Witnesses: R. Campbell

## **VECC INTERROGATORY #2**

#### INTERROGATORY

Reference: Exhibit B, Tab1, Schedule 1 page 14 Paras 32 Issue 1.2: What is the method for incentive regulation that the Board should approve for each utility?

- a) Is the formulation, without growth factor shown, as GDPIPI-X=1.86%+0.15%=2.01% EGD's final proposal, or does EGD intend this to be subject to new analysis and revision.
- b) Provide historical growth factors
- c) Provide EGD's estimate of its proposed 2008/2007 growth factor.

## **RESPONSE**

a) EGD's final proposal is contingent upon the final inflation factor, which will change when the requisite data are available (see Exhibit B, Tab 2, Schedule 1 for details).

The Company has corrected its evidence with respect to the X-factor, and its updated proposal is -0.77%.

The GDPIPI-X formula would be used as a base to escalate the Revenue Requirement per customer, and would not be subject to new analysis over the incentive regulation term. The components of the total escalation formula (which can be found at Exhibit B, Tab 1, Schedule 1) that would be subject to analysis and intervenor scrutiny relate to the customer and volumetric data.

- b) The historical growth factors components can be found at Exhibit B, Tab 3, Schedule 1, Table 3 (corrected).
- c) EGD's estimate of the proposed growth factor components for 2008 rates can be found at Exhibit C, Tab 4, Schedule 1.

Witnesses: T. Ladanyi

Issue 1.3: Should weather risk continue to be borne by the shareholders, and if so what other adjustments should be made?

- a) Provide EGD's position on weather risk.
- b) Provide a Table showing actual and approved normalized and un-normalized Returns on Equity for the period 1997-2006.
- c) Provide EGD's views and estimates of how many basis points on ROE is associated with weather risk, given its heat-sensitive volumes.

## **RESPONSE**

- a) Please see the response to Board Staff Interrogatory #5 at Exhibit I, Tab 1, Schedule 5.
- b) Please see the response to SEC Interrogatory #49 at Exhibit I, Tab 11, Schedule 49.
- c) Weather risk is generally diversifiable by investors, it is an unsystematic risk, and as such, has little to no bearing on the return required by investors in the Company's equity.

Please refer to EB-2006-0034, Exhibit I, Tab 28, Schedule 1, page 1 of 24, where, Dr. Booth in response to interrogatory 1b) indicates that weather risk should not be a factor in setting the firm's financial parameters because it is a diversifiable risk.

Issue 2.4 Should the gas utilities ROE be adjusted in each year of the incentive regulation (IR) plan using the Board's approved ROE guidelines?

- a) Provide EGD's position on an annual adjustment to ROE.
- b) With reference to the 15 utilities in the Ecoanalysis (sic) Consulting Services survey [D-5-1]. How many have annual ROE adjustments?
- c) How many have Weighted Average Cost of Capital adjustments?
- d) If an annual ROE adjustment is proposed what, if any, materiality threshold would be appropriate in order to reduce regulatory burden.
- e) If other capital components are to be adjusted, for example debt cost, due to changes resulting from embedded debt replacement, what materiality threshold(s) would be appropriate?

# <u>RESPONSE</u>

- a) d) and e) EGD does not propose an annual ROE adjustment or the weighted average cost of capital during the IR term.
- b) and c) The Econalysis Survey is provided in evidence at Exhibit D, Tab 5, Schedule 1.

Witnesses: R. Campbell

## **VECC INTERROGATORY #5**

# **INTERROGATORY**

Reference: No Reference

Issue Number: 3.1 and 3.2

Issue: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

<u>Preamble:</u> "A productivity challenge is inherent in the fact that the revenue growth provided by the proposed formula is significantly lower than revenue growth provided by recent cost of service regulation"

- a) Provide the following additional data on EGD's *distribution revenue requirement* and unit rates that support the statement in both <u>tabular and graphical format</u> for the 10 year period 1997-2006 [B-1-1 Table 1 Page 9]
  - i) All rates in aggregate:

Gross throughput, # customers, average volume per customer, approved revenue requirement, actual revenue, forecast and actual average unit rate.

- ii) for Rate 1 (Residential):
- volume throughput, # customers, average volume per customer, approved revenue requirement, actual revenue, forecast and actual unit rate.
- iii) Show historical Inflation -CPI and GDPIPI on the same graphs.
- b) Provide a table showing EGD's total factor productivity for the period 1997-2006.
- c) Highlight EGD's change total factor productivity in the TPBR plan period (October 1, 1999-September 30, 2002) relative to the average productivity over the 10 year period. Discuss the reasons for any observed differences.

# **RESPONSE**

a. i) The table and charts show forecast aggregate gross throughput, number of customers, average volume per customer, approved revenue requirement and average unit rate for all rate classes. The Company has not determined such information on an actual basis, given the amount of work required and the resources available to derive such information, the Company is not able to provide information based on actuals for the 1997 to 2006 period.

b) TFP data cannot be calculated for periods prior to year 2000. As PEG states at page ii of it June 2007 report,

Due to the restructuring of Ontario's gas industry in 1998 and other special circumstances, the sample period for the Enbridge and Union indexing work was limited to 2000-2005.

Then later, at page 24,

Note, also, that Enbridge reported that a change in accounting practices compromised the comparability of data from the 1990s. Faced with these circumstances we chose to focus on the 2000-2005 period for our Ontario productivity research.

Therefore, it is not possible to produce a TFP index for the period 1997 to 2006.

c) Since a TFP index cannot be produced for the period 1997 to 2006, it is not possible to compare or observe differences in relative TFP indexes.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 6 Page 2 of 4

Enbridge				
	PEG (March 2007)	<u>PEG</u> (June 2007)	Enbridge Gas Distribution	PEG June 2007 less EGD
X-Factor	0.30	2.25	-0.77	3.02

The table above illustrates the calculation of the differences, by X-Factor component, between PEG's June 2007 report and EGD's corrected X-Factor proposal.

As the evidence stated at paragraph 95, the Company has done its best to respond to PEG's June 2007 report that was so fundamentally different from the March 2007 report. Given the inability for the Company's experts to verify and/or respond to PEG's report, the Company proposed using historical data to establish the TFP benchmark. Once the Company's experts have had a chance to assess the PEG results, the Company may be required to change its X-Factor proposal. As it stands now, the differences between EGD's current recommendation and PEG's current report are briefly described below. For a more in depth review, please refer to Exhibit B, Tab 3, Schedules 1, 2, and 3.

<u>TFP</u><sup>industry</sup> – PEG's econometric model suggests the industry TFP is 1.91%. EGD history is -0.70% for a difference of 2.62%. The Company's TFP is based on actual historical EGD outputs and inputs over the time period 2000 to 2005, the period for which data is available. PEG derives its estimate from an econometric model of a sample of U.S. utilities to estimate the Company's costs and then to derive estimated cost elasticities for the Company and then PEG includes the estimated U.S. rate of technological change (calculated as 1.19%) to derive a total estimated industry TFP. PEG's sample period for the industry TFP is mixed in that the estimated coefficients for U.S. utilities are measured over the 1994 to 2004 period and applied to the Company for the period 2000 to 2005 to derive the estimated elasticities, and then this is combined with the U.S. rate of technological change (the trend component of their U.S. model) estimated over the 1994 to 2005 period. Furthermore, PEG measures the industry TFP on a cost-weighted basis, while the Company measures the industry TFP on a revenue-weighted basis.

<u>TFP</u><sup>economy</sup> – PEG's report contains a TFPeconomy of 1.02% and the Company's TFPeconomy is 0.72%, for a difference of 0.30%. The difference is due to different sample periods. PEG's uses a 1999 to 2005 sample period since they argue the sample period must include real rates of return that have similar beginning and ending

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 6 Page 3 of 4

values. The Company uses a 2000 to 2005 sample period since this is the period for which Company data is available.

<u>Productivity Differential (PD)</u> – PEG's calculated PD is 0.89% (1.91 – 1.02) and the Company's calculated PD is -1.42% (-0.70 – 0.72). The difference between the PD's is 2.32%.

Input Prices economy – PEG's calculation of the economy-wide input prices is 2.87%. The Company's calculation of the economy-wide input prices is 2.49%, for a difference of 0.39%. PEG's uses a 1999 to 2005 sample period since they argue the sample period must include real rates of return that have similar beginning and ending values. The Company uses a 2000-2005 sample period since this is the period for which Company data is available.

<u>Input Prices</u> – PEG calculates the industry-wide input prices using the Geometric Decay approach by calculating the cost of capital, and then including this with labour and other materials prices to derive an estimate of 2.02% over the period 1999 to 2005. The Company uses historical actual input prices over the sample period 2000 to 2005, for a difference of 0.19%.

<u>Input Price Differential (IPD)</u> – PEG's calculated IPD is 0.86% (2.88 – 2.02) and the Company's calculated IPD is 0.66% (2.49 – 1.83). The difference between the IPD's is 0.20%.

<u>Output</u><sup>revenue-weighted</sup> – Neither PEG nor EGD includes a revenue-weighted output number into the RCI X-Factor calculation. Therefore, the difference is 0.

Output<sup>elasticity-weighted</sup> – Neither PEG nor EGD includes an elasticity-weighted output number into the RCI X-Factor calculation. Therefore, the difference is 0.

<u>Average Use Factor (AU)</u> – Neither PEG nor EGD include an Average Use Factor into the RCI X-Factor calculation. Therefore, the difference is 0.

<u>Stretch Factor</u> – PEG recommends a stretch factor of 0.50%. The Company recommends a stretch factor of 0.00%. The difference is therefore 0.50%. PEG recommends a stretch factor on the basis of an "incentive power model" developed by PEG and based on precedent. Reasons underpinning the Company's proposal to remove the stretch factor can be found in Exhibit B, Tab 3, Schedules 1, 2, and 3.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 6 Page 4 of 4

 $\underline{\text{RCI X-Factor}}$  – PEG's June 2007 calculated RCI X-Factor is 2.25% (0.89 + 0.86 + 0.50) and the Company's calculated RCI X-Factor is -0.77% (-1.43 + 0.66). The difference between the RCI X-Factors is 3.02%.

# **VECC INTERROGATORY #7**

#### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Pages 3-5, Paras. 7-14

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: Para 14 States

"Using U.S. data to establish a proxy for Canadian firms is only reasonable if there is a simultaneous adjustment to account for the measured productivity gap."

- a) With regard to Table 1-Canadian Utility Average Annual TFP Productivity Growth Rates. Please Indicate:
  - i) Number of utilities in the Canadian sample compared to PEG's US Sample.
  - ii) Number of Utilities in Ontario sample compared to PEG's US sample.
  - iii) Statistics for Canadian and Ontario groups (standard deviation and t-statistic, if available)
- b) What is your conclusion (as relevant to EGDs historic TFP Growth) from Table 1 and para 10?
- c) With reference to Table 2 please provide
  - i) Number of utilities in the Canadian and US sample compared to PEG's US Sample.
  - ii) Statistics for Canadian and Ontario groups (standard deviation and t-statistic, if available)

# <u>RESPONSE</u>

a) Updated CSLS data is available at SEC Interrogatory #30, which can be found at Exhibit I, Tab 11, Schedule 30.

The Company does not have access to the methodology used by the CSLS to determine the TFP estimates.

b) Updated CSLS data is available at SEC Interrogatory #30 at Exhibit I, Tab 11, Schedule 30.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 7 Page 2 of 2 Plus Attachment

The updated CSLS tables show that Canadian Natural Gas Utilities saw productivity growth over the period 2000 to 2005 of -3.9%. Over the most recent 5- and 10-year periods, Canadian Natural Gas Utilities have seen productivity growth of -1.8% and -1.7%, respectively. The conclusion that is drawn is that the Company's calculated 2000-2005 TFP of -0.70% is less than that for the aggregate Canadian Natural Gas Utilities. This demonstrates that the Company's productivity record has fared reasonably well on a relative basis.

c) The Company does not have access to the detailed statistical data behind Table 2. The referenced report is attached, entitled "Rao, Tang, Wang – What Explains the Canada-US TFP Gap". The report includes the authors' discussion of their data and references.

#### Abstract

Canada's per-capita gross domestic product (GDP) was about 15 percent below the U.S. level in 2005 and the gap has widened slightly in recent years. The Canada-U.S. labour productivity level gap, according to many recent studies, accounted for almost the entire real income gap between the two countries. The gap in capital-labour ratio explained directly about 10 percent of the business sector labour productivity gap in 2004. The remaining 90 percent of the labour productivity gap was due to the gap in total factor productivity (TFP). The objective of this paper, using panel data on 41 industries, is to analyze the factors accounting for the Canada-U.S. TFP gap in the business sector. The regression results show that differences in machinery and equipment (M&E) capital-labour ratio, trade openness and capacity utilization explain well the Canada-U.S. TFP gap across industries over time. The M&E capital intensity gap is the dominant source of the Canada-U.S. TFP gap.

Key words: total factor productivity, the Canada-U.S. productivity gap, capital intensity

#### Résumé

En 1995, le produit intérieur brut (PIB) par habitant au Canada était inférieur d'environ 15 % à celui des États-Unis, et l'écart s'est légèrement élargi ces dernières années. Selon de nombreuses études récentes, l'écart sur le plan de la productivité du travail entre le Canada et les États-Unis explique presque entièrement l'écart sur le plan du revenu réel entre les deux pays. L'écart au chapitre du ratio capital-travail explique directement environ 10 % de l'écart au chapitre de la productivité du travail du secteur des entreprises en 2004. La proportion restante de l'écart, soit 90 %, est attribuable à l'écart au chapitre de la productivité totale des facteurs (PTF). À l'aide des données recueillies au moyen d'un panel sur 41 industries, les auteurs de la présente étude ont analysé les facteurs responsables de l'écart en matière de PTF entre le Canada et les États-Unis dans le secteur des entreprises. Les résultats de la régression montrent que les différences sur les plans du ratio capital-travail dans les machines et le matériel (M&M), l'ouverture au commerce extérieur et l'utilisation de la capacité expliquent bien l'écart sur le plan de la PTF des industries entre le Canada et les États-Unis, au fil des ans. L'écart sur le plan de l'intensité du capital dans les M&M est principalement à l'origine de l'écart sur le plan de la PTF entre le Canada et les États-Unis.

Mots clés : productivité totale des facteurs, écart de productivité entre le Canada et les États-Unis, intensité de capital

#### 1. Introduction

The Canadian economy has performed very well since the mid-1990s in many aspects. Canada has outperformed other G7 countries in real GDP expansion and employment growth. Both inflation and real interest rates are low and stable by historical standards. Canada is the only G7 country with a surplus on both the overall government budget and current accounts. The government debt-GDP ratio has been falling steadily. All these positive trends bode well for the future prosperity of Canada.

Yet, because of Canada's lagging productivity performance, many observers are concerned about the medium-term prospects for Canada's economic growth and improvements in living standards. Labour productivity growth rate in the Canadian business sector averaged a meagre 1.0 percent, over the 2001-2005 period, compared to 2.4 percent during 1995-2000. On the other hand, labour productivity growth in the U.S. business sector accelerated in the post-2000 period, averaging 3.2 percent. Canada's productivity growth has also lagged behind many other OECD countries since 2000.<sup>2</sup>

Although there is a disagreement among researchers about the size of Canada-U.S. labour productivity level gap at the aggregate economy level, there is an agreement among them that Canada's labour productivity level (real GDP per hour) in the business sector is currently well below the U.S. level and the gap has widened in recent years.<sup>3</sup>

Canada is a small and open economy, relying heavily on foreign trade, foreign direct investment, immigration of skilled people and foreign technology flows. In view of intense global and North American competition for these productive resources, closing the Canada-U.S. productivity level gap is vital for narrowing the real income gap as well as for attracting and retaining physical and knowledge capital.

In a previous paper, we examined in some detail the role of capital deepening in the Canada-U.S. labour productivity gap in the business sector (Rao, Tang and Wang (2004)). We concluded that the gap in capital-labour ratio or the gap in capital deepening, accounted for only about 20 percent of the labour productivity gap in the business sector in 2001. The result implied that more than three quarters of the Canada-U.S. business sector labour productivity gap was due to the total factor productivity (TFP) level gap.

The objective of this paper is to analyze the reasons behind the Canada-U.S. TFP level gap in the business sector. Using time-series data (1987-2003) on 41 industries, we examine the factors behind the differences in the TFP gap across industries over time. The regression results suggest that the Canada-U.S. gap in machinery and equipment (M&E), including ICT capital, and differences in trade openness and capacity utilization all explain inter-industry differences in the TFP level gap over time. However, the regression results imply that the M&E gap is the

dominant explanatory variable. Of course, the M&E gap is closely related to the human capita  $^{\text{gage 9 of 33}}$  and R&D-intensity gaps.

The paper is organized in the following way. Section 2 provides an overview of the Canada-U.S. labour productivity and TFP gaps, disaggregated by industry. An outline of the empirical model of the TFP gap is provided in section 3. An analysis of trends in explanatory variables is presented in section 4. Regression results are discussed in section 5. The final section, section 6, summarises the key findings of the paper and discusses their implications for policy and future research.

# 2. Trends in Canada-U.S. Labour Productivity and TFP Gaps

Before we proceed with the discussion of empirical model of the TFP gap and the regression results, it would be useful and informative to examine recent trends in the Canada-U.S. labour productivity and TFP gaps. Using the methodology in one of our earlier papers (Rao, Tang and Wang (2004)), we estimated the labour productivity gap in the business sector for the period 1987-2005 and the TFP gap in the business sector for the period 1987-2004. At the industry level (41 industries), both the labour productivity and TFP gaps are updated for the period 1987-2004

Unlike our earlier paper, labour input at the industry level is persons employed rather than total hours worked. However, the ideal labour input measure is hours worked. We switched to number of employees in this paper because comparable U.S. hours data at the industry level are not readily available. For our earlier paper (Rao, Tang and Wang (2004)), we obtained hours data from the Jorgenson Project, which developed comparable data for the two countries on labour and other inputs and output for the period 1987-2000.

In this paper, we extend the analysis in Rao, Tang and Wang (2004) up to the year of 2004, using employment data. Since, on average, Canadians work about 10 percent less hours per employed person in a year than their U.S. counterparts, the Canada-U.S. labour and TFP gaps measured in terms of number of employees is about 10 percentage points higher than the gaps measured in terms of hours worked.

#### Aggregate Trends:

The Canada-U.S. business sector labour productivity gap, using hours worked as labour input, increased from about 16 percent in 1995 to 26 percent in 2005. Much of the widening of the gap occurred after 2000. Similarly, the TFP gap increased from about 19 percent in 1995 to 24 percent in 2004 (Figure 1). The TFP gap is the dominant source of the business sector labour productivity gap. For instance, in 2000, the TFP gap accounted entirely for the business sector

<sup>&</sup>lt;sup>4</sup> The term "business sector" used in this paper is defined as NAICS-based all industries excluding education service (NAICS 61), health service (NAICS 62) and public administration (NAICS 91). It should be noted that this definition differs from the Statistics Canada definition of the business sector, which includes the business sector components of education and health services. Unfortunately, data limitations prevented us from adding these subindustries to the business sector. Since data for the business sector are less subject to measurement error and since international competitiveness is largely shaped by business sector productivity, we concentrate on the business sector productivity level comparisons.

labour productivity gap, compared to 90 percent in 2004. The reduced importance of the TFP page 10 of 33 gap implies that the widening of the gap in capital deepening between the two countries in the past 10 years was largely responsible for the widening of the business sector labour productivity gap in recent years.

According to our estimates, the deterioration of productivity performance is more serious in the manufacturing sector than in the rest of the economy. The manufacturing sector labour productivity gap, measured in terms of hours worked, steadily increased from a mere 10 percent in 1995 to more than 31 percent in 2004 (Figure 2). Similarly, the TFP level difference deteriorated from a 2 percent advantage in 1995 to a gap of 25 percent in 2004. Once again, the TFP gap was the dominant source of the labour productivity gap in the manufacturing sector in recent years. However, unlike the aggregate business sector, the contribution of TFP gap to the labour productivity gap in the manufacturing sector increased a great deal in the post-1995 period.

As expected, the productivity gap estimates, measured using employees as labour input, are about 10 percentage points higher than the estimates with hours worked as labour input (Figure 3 and Figure 4). For example, in 2004, the business sector labour productivity gap is estimated at 37 percent, compared to 26 percent with data on hours worked. In the manufacturing sector, the estimated labour productivity gap in 2004 was 42 percent, while with hours-worked data, the gap was only 31 percent.

Although there is disagreement among researchers about the size of the Canada-U.S. labour productivity gap at the aggregate economy level, measured using hours-worked data, there is a general consensus about the widening of the productivity gap in the post-1995 period. In addition, all available estimates suggest that the business sector labour productivity gap is fairly large, ranging between 20 and 28 percent for 2005. Since data for the non-business sector are not of reliable quality and long-term international competitiveness is mainly shaped by productivity in the business sector, we concentrate on the business sector.

# Industry Dimension:

The industrial disaggregation in this paper is based on NAICS classification system rather than SIC system used in our 2004 paper. As mentioned above, industry level productivity gap estimates in this paper use employment data for labour input. Therefore, the estimates in this paper, where comparable, are higher than the estimates reported in our earlier paper, on average, by about 10 percentage points.

# Labour productivity gaps:

There is a great deal of divergence in Canada's productivity level gaps across industries and major sectors, and the differences have increased over time. For instance, in 2004, Canada's labour productivity in the service sector was only 55 percent of the U.S. level, compared to a productivity advantage of over 50 percent in the construction sector (Table 1).

Canada still enjoys a significant (over 6 percentage points) labour productivity advantage over the U.S. in mining, wood, printing, and primary metals. In transportation equipment and paper and paper products industries, Canada's productivity levels are similar to those in the U.S. Nevertheless, they have lost a significant ground to the U.S. since 2000 (Table 1).

On the other hand, in other industries, Canada's productivity levels are considerably below those in the U.S. The productivity disadvantage is really acute (more than 50 percent) in apparel and leather, fabricated metals, computers and electronics, electrical equipment, utilities, information and cultural, professional services and arts and entertainment industries. In all of these industries, Canada lost ground to the U.S. between 1995 and 2003. During this period, in the computer and electronics industry, the Canada/U.S. productivity ratio steadily declined from 1.28 to 0.21 (Table 1). The labour productivity in this Canadian industry grew at 14.5 percent per year during 1995-2000, but declined at 6.8 percent per year during 2000-2004. Meanwhile, the labour productivity of its U.S. counterpart grew much faster, 36.2 percent per year for 1995-2000 and 18.1 percent per year for 2000-2004.

# TFP gaps:

The industrial performance of the TFP gap is very similar to that of the labour productivity gap, but the differences across industries are somewhat smaller. Canada also has a TFP advantage in mining, construction, wood, printing, and primary metals. In addition to these industries, Canada's TFP level is higher than that in the U.S. in food, beverage and tobacco, non-metallic minerals, transportation equipment, and other private services (Table 1). On the other hand, Canada's TFP disadvantage in 2004 was large in many service industries, averaging 39 percent for the service sector as a whole (Table 1).

Canada lost significant ground in TFP in 23 industries since 2000, compared to 24 industries for labour productivity. Moreover, in the computers and electronics industry, the loss in TFP advantage is substantive---the Canada-U.S. TFP ratio declined from 1.85 in 1995 to 0.78 in 2000 and to 0.23 in 2004 (Table 1).

In short, the TFP gap is the dominant source of Canada's labour productivity advantage and disadvantage across industries. Therefore, a better understanding of the causes of the TFP gap is critical for developing effective policies for closing the Canada-U.S. productivity gap and improving Canada's international competitiveness.

#### 3. The Model

In this section, we outline the empirical model we used to study the factors behind the TFP gap. The model is based on the production function approach, in which TFP is modelled, rather than assume that it is exogenously given.

We assume that each industry gross output in both Canada and the U.S. is a function of labour, capital, intermediate inputs and TFP or technical progress:

(1) 
$$Q_i = F_i(L_i, K_i, M_i, TFP_i)$$
,  $i = 1, ... 41$ , for Canada and the U.S.,

where  $Q_i$  denotes gross output in constant dollar, and  $L_i$ ,  $K_i$ , and  $M_i$  are labour, capital and intermediate inputs, respectively.

Assuming a simple Cobb-Douglas functional form for equation (1), constant returns to scale and separability of intermediate inputs from primary inputs (labour and capital), we can write equation (1) in terms of value-added:

(2) 
$$V_i = Q_i - M_i = G_i(L_i, K_i, TFP_i), i = 1, ... 41.$$

Equation (2) can be expressed in terms of value-added labour productivity:

(3) 
$$V_i/L_i = H_i(K_i/L_i, TFP_i), i = 1, ... 41.$$

Value-added labour productivity is a function of capital-labour ratio (capital deepening) and TFP. Under the assumption of the Cobb-Douglas functional form for the value-added production function and constant returns to scale, equation (3) can be re-written in log form as:

(4) 
$$\ln(y_i) = a_i * \ln(k_i) + \ln(TFP_i), i = 1, ... 41,$$

where  $y_i$  is value-added labour productivity,  $k_i$  is the capital-labour ratio,  $TFP_i$  is total factor productivity or technical progress, and  $a_i$  is the elasticity of output with respect to capital input.

According to equation (4), value-added labour productivity growth will be equal to the contribution of capital deepening (changes in the capital-labour ratio) plus TFP growth.

In this paper, we will model the variation in TFP gap across industries over time. To accomplish this goal, we assume that TFP in each industry responds to changes in M&E capital (including ICT capital), human capital or skills, R&D, trade openness and capacity utilization (business cycle):

(5) 
$$TFP_i = J_i(m_i, s_i, r_i, o_i, b_i), i = 1, ..., 41,$$

where  $m_i$  is the M&E capital-labour ratio,  $s_i$  is the percentage of employees with a university degree, a proxy for skills or labour quality,  $r_i$  is the R&D-GDP ratio,  $o_i$  is the ratio of exports and imports in value added, and  $b_i$  is capacity utilization (business cycle). ICT capital is part of the M&E capital.

Equation (5) implicitly assumes that TFP in the longer-term is influenced by both fundamental and applied innovation. R&D and human capital are assumed to be the main drivers of fundamental innovation. Applied innovation or adoption and diffusion of new and the state-of-art technologies are expected to be influenced largely by M&E capital and human capital. Of course, all three variables are interrelated. Therefore, it is difficult to empirically disentangle precisely their separate impact on TFP (see Harris (2002) and Rao, Tang and Wang (2004) for a detailed discussion on the importance of these three variables for productivity). Changes in capacity utilization also impact productivity in the short-term, because of delays in fully adjusting inputs and outputs to changes in relative prices, technologies and business cycles.

Past theoretical and empirical research suggest that trade openness is also an important determinant of TFP, because of its positive impact on competition, economies of scale and specialization, and technology and knowledge transfer. To capture the impact of differences in trade openness on productivity, we added the ratio of exports and imports to value added as a separate explanatory variable in equation (5).

Recent research suggests that ICT capital contributes significantly both directly and indirectly to labour productivity growth in Canada and other OECD countries.<sup>5</sup> They contribute directly through capital accumulation and capital deepening. They also could contribute indirectly through their significant positive impact on organisational and applied innovation and network effects, often referred as spillovers or externalities. In an effort to check if ICT capital impacts TFP differently from non-ICT M&E capital, we included the ratio of ICT capital to total M&E capital as an additional explanatory variable in the TFP equation:

(6) 
$$TFP_i = J_i(m_i, s_i, r_i, o_i, b_i, z_i), i = 1, ..., 41,$$

where  $z_i$  is the ratio of ICT capital to total M&E capital. For the purposes of this paper, we modify equation (6) in the following manner:

(7) 
$$\frac{TFP_i^{CA}}{TFP_i^{US}} = N_i \left( \frac{m_i^{CA}}{m_i^{US}}, \frac{s_i^{CA}}{s_i^{US}}, \frac{r_i^{CA}}{r_i^{US}}, \frac{o_i^{CA}}{o_i^{US}}, \frac{z_i^{CA}}{z_i^{US}}, b_i^{CA} - b_i^{US} \right), \quad i = 1, ..., 41.$$

Equation (7) expresses the Canada-U.S.TFP ratio or the TFP gap as a function of the M&E capital intensity gap, skills gap, R&D intensity gap, the ratio of trade openness in the two countries, the ratio of ICT capital share in Canada to the U.S share and differences in capacity utilization in the two countries. Using the time-series data on 41 industries, we estimated the parameters of equation (7).

# 4. A Discussion of Explanatory Variables

In this section, we examine recent trends in explanatory variables, disaggregated by industry. This analysis will be very helpful to the reader for appreciating better the regression results. Definitions of variables and data sources are given in Annex A.

M&E capital gap:

In 2004, in all four major sectors of the economy, the M&E capital/labour ratio in Canada was considerably below the U.S. level. The M&E capital intensity gap varied from a low of 21 percent in construction to over 50 percent in the service sector. In the manufacturing sector, the M&E capital intensity gap widened a great deal since 1995. It increased steadily from 26 percent in 1995 to 46 percent in 2004 (Table 2).

Within the manufacturing sector, with the exception of wood and paper industries, the M&E capital intensity is well below the U.S. level in all of Canadian industries. In 2004, the M&E capital gap varied from a low of 16 percent in transportation equipment industry to a high of 86

<sup>&</sup>lt;sup>5</sup> See Pilat (2005), Fuss and Waverman (2005), Jorgenson (2004), and Rao and Tang (2004).

percent in machinery industry (Table 2). In paper and wood industries, Canada's M&E capital advantage declined dramatically (between 23 and 26 percentage points) in the last 10 years.

The M&E capital intensity gap is considerably below the U.S. level in all service industries in Canada. In 2004, the gap varied from a low of 34 percent in information and cultural service industry to over 83 percent in accommodation and food (Table 2).

# Importance of ICTs in M&E capital:

The ICT capital share in the Canadian business sector increased from 15.6 percent in 1995 to 20.0 percent in 2003. In addition, its share in M&E capital increased in three of the four major Canadian sectors since 1995. But, the importance of ICT capital varies a great deal across major sectors. The ICT capital share averaged about 31 percent in the service sector in 2003, while it averaged less than 5 percent in other three sectors (Table 3).

The share of ICT capital is bigger and increased faster since 1995 in the U.S. than in Canada in three of the four major sectors, while it is slightly smaller in the service sector.

In all Canadian manufacturing industries, the share of ICTs in M&E capital was below 10 percent in 2003, except in computers and electronics. In addition, the ICT capital share is significantly bigger in most of the U.S. manufacturing industries than their Canadian counterparts. Furthermore, in 2004, the ICT capital share in six U.S. manufacturing industries was above 10 percent, compared to only two industries in Canada. The ICT capital share averaged 11.6 percent in the U.S. manufacturing sector, compared to only 3.9 percent in Canada (Table 3).

Unlike manufacturing, the ICT capital share is significantly bigger in all Canadian service industries than in the U.S., except in transportation and warehousing and finance, insurance and real estate. But, at the aggregate service sector, there is no difference between the two countries. It averaged 32 percent in 2003 in both countries (Table 3).

### R&D-intensity gap:

In 2003, Canada's R&D/GDP ratio in the Canadian business sector was only 54 percent of the U.S. level. In addition, the R&D intensity was less than 10 percent of the U.S. level in the primary sector, compared to 59 percent in the manufacturing sector. The R&D gap at the aggregate business sector level remained more or less constant since 1995. On the other hand, the R&D-intensity gap in the manufacturing sector declined from 52 percent in 1995 to 41 percent in 2003 (Table 4).

There is a wide variation in the R&D-intensity gap across manufacturing industries in 2003. Canada's R&D-intensity is well above the U.S. level in textiles, primary metals and computers, and electronics industries. On the other hand, the gap is above 80 percent in printing, plastics and rubber, and non-metallic minerals (Table 4). In eight of the 18 manufacturing industries, the R&D gap narrowed significantly since 1995, while the gap widened in the remaining industries. In the transportation equipment industry, the gap declined from 80 percent in 1995 to 65 percent

in 2003. On the other hand, in the electrical equipment industry, the R&D gap increased by  $34^{age 15 \text{ of } 33}$  percentage points, reaching 63 percent in 2003. Like manufacturing, there is also considerable divergence in the R&D-intensity gap across service industries. Canada's R&D intensity is well above the U.S. level in professional services, while the gap is over 90 percent in transportation and warehousing.

# Skills gap:

As in Rao, Tang and Wang (2002), the share of hours with university education in total hours is used as a proxy for skills-intensity or labour quality in this paper. Canada also lags behind the U.S. in terms of skills-intensity. In 2000, the skills gap between Canada and the U.S. was 32 percent in the business sector, although the gap narrowed somewhat since 1995. In all the four major sectors, there is a large skills gap, varying from a low of 28 percent in the service sector to a high of 45 percent in the manufacturing sector (Table 4).

Canada's skills-intensity is significantly below the U.S. level in all of the manufacturing industries. The skills gap is over 52 percent in electrical equipment and transportation equipment (Table 4). Within the service sector, Canada has a considerable skills advantage in professional and administrative services. On the other hand, the skills gap is over 57 percent in transportation and warehousing.

# Trade openness:

As expected, trade openness (ratio of exports and imports to value added) is considerably bigger in the Canadian manufacturing sector than in the U.S., 3.3 vs. 1.3. Similarly, in the primary sector also Canada leads the U.S. by a significant margin. Nevertheless, trade openness declined significantly in Canada between 2000 and 2003 in the manufacturing sector, while it increased in the U.S., leading to a narrowing of Canada's advantage (Table 5). We could not obtain data on trade openness variable for construction and service industries for Canada as well as the U.S. For these industries, we assumed the ratio of Canada's trade openness to the U.S. openness to be one in our regression analysis.

Within the manufacturing sector, trade openness varies a great deal across individual industries in both Canada and the U.S. In 2003, the ratio in Canada varied from a low of 0.5 in printing to 9.7 in computer equipment and electronics. For the U.S., trade openness ratio varied between 0.2 and 5.4 (Table 5). Canada's trade openness ratio exceeded the U.S. ratio in all manufacturing industries (except apparel and leather). In 11 of 18 Canadian manufacturing industries, trade openness fell between 2000 and 2003. In contrast, trade openness declined in only two U.S. manufacturing industries.

In summary, Canada generally lags behind the U.S. in M&E capital, skills and R&D intensity. Nevertheless, Canada has an advantage in some individual industries in all three areas. The share of ICT capital in total M&E capital is more or less same at the aggregate business sector level in the two countries. Canada leads the U.S. in trade openness, but the advantage narrowed significantly since 2000.

# 5. Regression Results

Using the time-series data (1987-2003) on 41 industries, we ran a number of regressions of the above Equation (7).<sup>6</sup> For the sake of analytical convenience, we have reported in Table 6 only three regression equations.<sup>7</sup>

All three regressions control for industry fixed effects. They explain about 90 percent of interindustry variations in TFP gap over time. As expected, the coefficients on M&E capital intensity, share of university hours and R&D intensity, trade openness and capacity utilization (the proxy for business cycle) are positive (column 1, Table 6).

The coefficient on the M&E capital gap is highly significant, and the size of the coefficient is fairly robust across various alternative specifications of Equation (7) (Annex B and Table 8). The coefficient on the M&E capital intensity implies that a one percent increase in the M&E capital intensity gap would raise the TFP gap by about 0.13 percent, and vice versa. This result implies that M&E capital (including ICT capital), by embodying new technologies, would stimulate applied innovation and technology transfer, and raise TFP. Hence, a reduction in the M&E capital gap would reduce the labour productivity gap directly via the capital deepening impact as well as indirectly by reducing the TFP gap.

The coefficient on trade openness has the expected positive sign and is significant in all the three regressions. As expected, the coefficient on capacity utilization (business cycle) is positive and highly statistically significant. Hence, it is important to control for the influence of the short-term differences in business cycles in the two countries on the Canada-U.S. TFP gap. Of course, the longer-term impact of this variable on the TFP gap is expected to be very small.

However, the coefficients on share of university hours and R&D intensity are not statistically significant. The lack of significance of the coefficients on share of university hours and R&D intensity could be due to high correlation between the skills, R&D and M&E capital.<sup>8</sup> Therefore, it is difficult to disentangle accurately the influence of each of the three variables on the TFP gap. In the regressions without M&E capital intensity, R&D intensity becomes significant (columns (2) and (3), Table 6)

Contrary to expectations, the coefficient on the Canada-U.S. gap in the share of ICT capital in M&E capital is negative and statistically significant. The negative coefficient on the ICT share variable, however, does not imply that a reduction in ICT capital gap increases the TFP gap. On

6

<sup>&</sup>lt;sup>6</sup> The sample is only up to 2003 since we only have data up to 2003 for most of the explanatory variables.

<sup>&</sup>lt;sup>7</sup> The estimation method we use is period SUR with panel-corrected standard errors (PCSE) (Beck and Katz (1995)). The associated covariance structures allow for arbitrary period serial correlation and period heteroskedasticity between the residuals for a given cross-section, but restricted residuals in different cross-sections to be uncorrelated. The advantage of this estimation method is that it can take care of period heteroskedasticity and serial correlation without using the lagged dependent variable. In Annex B we present alternative estimation results using FGLS with cross-section weights to take care of cross-sectional heteroskedasticity.

<sup>&</sup>lt;sup>8</sup> The findings in Rao, Tang and Wang (2006) support a complementary relationship between M&E capital, skills and R&D. Note also that we only have data up to 2000 for the skill variable and assume the Canada-U.S. relative level has been unchanged since 2000. This assumption might impact the estimation results.

the contrary, our regression results suggest that the ICT capital gap is as important as the non-Page 17 of 33 ICT M&E capital gap for the TFP gap, but it does not have an additional impact on the productivity gap. For instance, when we replace the M&E capital gap with the ICT capital gap (column 2), the coefficient on the ICT capital gap is positive and statistically significant. But, the size of the ICT capital gap variable is considerably smaller than the coefficient on the M&E capital gap (column 1), and the explanatory power of equation is weaker than the equation with the M&E capital gap. Our results that ICT capital does not seem to play a special role in explaining inter-industry differences in the Canada-U.S. TFP gap is broadly consistent with the findings of other researchers about the absence of productivity spillovers from ICTs (see Stiroh (2002), Bosworth and Triplett (2004) and Harchaoui and Tarkhani (2005)).

In short, our regression results suggest that the differences in ICT capital shares in the two countries did not contribute to the TFP gap. Nevertheless, these are important findings. We intend to check for the robustness of these results with further in-depth research on the impact of ICTs on TFP in Canadian and U.S. industries.

In summary, the M&E capital gap (including ICT capital gap), the skills gap and the R&D gap, trade openness gap all contributed to the TFP gap. But, the regression coefficients imply that the M&E capital gap alone was responsible for over 90 percent of the business sector TFP gap in 2003, computed at the sample mean. The gaps in skills and R&D contributed about 5 percent to the gap (Table 7).

It is important to note that, however, given a high degree of correlation and complementarity among the M&E, skills and R&D, these decomposition results should be used with caution. But, it is clear from the regression results that the M&E capital gap is the dominant source of the TFP gap.

#### 6. Conclusions

The main objective of this paper has been to examine inter-industry variations in Canada-U.S. TFP gap over time and analyse main reasons for the TFP level gap. Towards this objective, using comparable time-series data for the period 1987-2003 on 41 Canadian and U.S industries, first, we estimated the TFP gaps by industry. Next, we developed and estimated an empirical model of the TFP gap.

The following are the key findings:

- The Canada-U.S. TFP gap in the business sector, measured using hours as labour input, increased from 19 percent in 1995 to 24 percent in 2004;
- The TFP gap accounted for 90 percent of the business sector labour productivity gap in 2004, but its contribution declined significantly since 1995;
- Employee- based labour productivity and TFP gaps in general are about 10 to 12 percentage points larger than hours-based gap estimates, because Canadians on average work about 10 percent less hours per year than their U.S. counterparts;

- Canada has a significant productivity advantage over the U.S. in mining, resource-based manufacturing industries and construction. On the other hand, the productivity gap is large in service industries and high-tech manufacturing industries, especially in computers and electronics:
- The regression results suggest that the M&E capital intensity gap, trade openness and capacity utilization have all contributed to the Canada-U.S. TFP gap. The estimated coefficients, however, imply that the M&E capital intensity gap was the dominant source of the TFP gap. Of course, given that the gaps in M&E capital intensity, R&D intensity and skills are interrelated and complement one another, it is difficult to separate out neatly the effect of each of the gaps on the TFP gap.

Our results imply that closing the M&E capital intensity gap is crucial for closing the labour productivity and real income gaps with the U.S. A reduction in the M&E capital intensity gap reduces the labour productivity gap directly via the capital deepening effect, and indirectly by stimulating applied innovation (adoption and diffusion of new technologies), and reduces the TFP gap. In addition, an increase in M&E capital would also increase investments in skills and R&D, because of complementarity between the three variables.

Recent research suggests that ICT capital imparts significant positive productivity spillovers because ICTs are general-purpose technologies<sup>9</sup>. However, our empirical results imply that the TFP impact of ICT capital is the same as that of non-ICT M&E capital. Given the importance of estimates of spillovers for policy discussions, a more in-depth empirical analysis of the impact of ICT capital on TFP in Canadian and U.S. industries would be very useful.

The results of this study point to the importance of improving the conditions for investment in M&E, which often leads to the adoption of new technologies. Investment spending has increased substantially over the past two years, reflecting in part the decline in investment prices associated with the appreciation of the Canadian dollar. This should help improve Canada's productivity performance. Moreover, a slowdown in labour force growth, associated with ageing of the population, will likely lead to further capital deepening as the relative price of capital to labour falls. Other factors that would be important for improving Canada's productivity performance are smart regulation, a competitive and efficient tax system, and openness to internal and international trade and investment.

<sup>&</sup>lt;sup>9</sup> Fuss and Waverman (2005) argue that the ICT capital gap accounted for 55% of the Canada-U.S. productivity gap in 2003 because of the huge network (spillover) effects.

#### **Annex A: Variable Definitions and Data Sources**

### Capital Intensity

Capital intensity is defined as capital stock per worker. The capital stock used is the private fixed non-residential geometric end-year net stock. Three types of capital intensities are used in the paper, i.e., total capital intensity, M&E capital intensity and ICT capital intensity. To calculate Canada-U.S. capital intensity level gap, capital stock in Canadian dollar for Canada is converted into US dollar using the Canada-U.S. bilateral total investment PPP values by industry for total capital stock and M&E investment PPP values by industry for M&E and ICT capital stock. All the PPP values are obtained from Rao, Tang and Wang (2004). All capital stock series are in chained-Fisher dollar and re-referenced to the year of 1999.

The Canadian data for total capital stock and M&E capital stock by industry are obtained from Statistics Canada (STC) CANSIM table 031-0002, and the Canadian data for ICT capital stock come from the Investment and Capital Stock Division of Statistics Canada. All capital stock data for the U.S. come from the U.S. Bureau of Economic Analysis (BEA) fixed assets tables.

The data used for Canadian employment from 1997 onward is the total number of jobs from STC CANSIM table 383-0010. These data are extended back to 1987 using the growth rates of the total number of jobs from STC CANSIM table 383-0003. The employment data for the U.S. is the number of persons engaged in production. The source for the data from 1998 onward is the BEA NAICS-based GDP-by-industry tables, which are extended back to 1987 using the growth rates of the number of persons engaged in production from the BEA1987 SIC-based GDP-by-industry tables.

# Total-Factor Productivity (TFP)

Canada-U.S. TFP gap is estimated using  $\ln(TFP^{CA}/TFP^{US}) = \ln(LP^{CA}/LP^{US}) - \overline{w}\ln(k^{CA}/k^{US})$ , where LP is GDP at factor cost per worker, k is capital intensity, and  $\overline{w}$  is the average capital share of income of the two countries.

GDP at factor cost in 1999 for Canada is obtained from STC CANSIM table 381-0013 and converted into US dollar using the Canada-U.S. bilateral GDP PPP values by industry from Rao, Tang and Wang (2004). The imputed value for owner-occupied dwellings is not included. The time series of GDP at factor cost in 1999 dollar are estimated using the growth rates of GDP at basic price in 1997 chained-Fisher dollar. The GDP at basic price in 1997 chained-Fisher dollar from 1997 onward come from STC CANSIM table 379-0017, which are extended back to 1987 using the growth rates of GDP at factor cost in 1992 constant dollar from STC CANSIM table 379-0001. The capital share of income is calculated using the data from STC CANSIM table 381-0013.

GDP at factor cost in 1999 for the U.S. is calculated using the data from BEA NAICS-based GDP-by-industry tables. The imputed value for owner-occupied dwellings is excluded using

<sup>&</sup>lt;sup>10</sup> Total capital includes structure and M&E capital. Land and inventory are not included.

BEA NIPA table 7-12. The time series of GDP at factor cost in 1999 dollar are estimated using the chained-Fisher quantity index for GDP at market price from BEA NAICS-based GDP-by-industry tables. The capital share of income is calculated using the same source tables.

#### Skills

The share of hours worked by workers with university degree and above in total hours worked is used as the indicator of skills. The data of hours worked by industry and by education for both Canada and the U.S. for the period of 1987 to 2000 are obtained from Jorgenson (2004). The shares are assumed to be unchanged since 2000.

# **R&D** Intensity

R&D intensity is defined as R&D expenditure to GDP ratio. The R&D expenditure data used for Canada is the intramural R&D expenditures that are obtained from the Science, Innovation and Electronic Information Division of Statistics Canada. The data from 1994 onward is NAICS-based. It is extended back to 1987 using the growth rates from the SIC-based data. The R&D data used for the U.S. is the total funds for industrial R&D performance. The sources of the data for non-agriculture industries are Table A-7 and Table A-13, Survey of Industrial Research and Development, 1998, 2000, 2001, the U.S. National Science Foundation. NAICS-based data are available for the period of 1997 to 2001 and SIC-based data are available for the period of 1988-1998. The growth rates from SIC-based data are used to extend NAICS-based data back to 1988. The data for 1987 are assumed to be the same as those for 1988, and the data for 2002 and 2003 are assumed to be the same as those for 2001. The data for the agriculture sector are obtained from the U.S. Department of Agriculture.

# Trade Openness

Trade Openness is defined in this paper as total merchandise trade (exports plus imports) to GDP (at factor cost) ratio. The trade data for Canada are NAICS based after 1992 and SIC based before 1992, and the trade data for the U.S. are NAICS based after 1997 and SIC based before 1997. The NAICS-based trade openness for both Canada and the U.S. are extended back to 1987 using the growth rates of the SIC-based trade openness. The NAICS-based trade data for Canada are obtained from Industry Canada Trade-on-line database, and the SIC based trade data are from Statistics Canada. The sources for Canadian GDP at factor cost are STC CANSIM table 381-0013 for NAICS-based data and CANSIM table 379-0001 for SIC-based data. The U.S. trade data are obtained from the U.S. International Trade Commission Trade Data Web, and the U.S. GDP at factor cost are obtained from the U.S. BEA GDP-by-Industry tables.

# Capacity Utilization

The output fluctuation is used as the indicator of capacity utilization because firms will adjust factor inputs accordingly in response to output change. The data used for output is real GDP by industry. The Hodrick-Prescott (H-P) filter is used to decompose GDP into two parts: the long-term trend and the short-term fluctuation. For normalization, the fluctuation is divided by the trend.

#### **Annex B: Alternative Estimation Results**

The estimation results in Table 6 are obtained using period SUR with PCSEs. The associated covariance structures allow for arbitrary period serial correlation and period heteroskedasticity between the residuals for a given cross-section, but restricted residuals in different cross-sections to be uncorrelated.

To check the robustness of the estimation results in Table 6, we re-estimate the impact of the same independent variables on the Canada-U.S. relative TFP level using reduced-form error-correction model (ECM). The feasible GLS (cross-section weights) with PCSEs is used to estimate the model. The ECM can be written as

**(B1)** 
$$\Delta y_t = \alpha + (\beta - 1)(y_{t-1} - \lambda X_{t-1}) + \gamma_0 \Delta X_t + \varepsilon_t.$$

The error-correction term is  $(\beta - 1)(y_{t-1} - \lambda X_{t-1})$ , where  $\lambda$  stands for the long-run impact of X on y. Equation (B1) can be re-written after a rearrangement of parameters as

**(B2)** 
$$y_t = \alpha + \beta y_{t-1} + \gamma_0 X_t + \gamma_1 X_{t-1} + \varepsilon_t$$
, with  $\lambda \equiv \frac{\gamma_0 + \gamma_1}{1 - \beta}$ .

Equation (B2) is an ADL(1,1) model. It is linear and easy to be estimated. The FGLS estimation results with cross-section weights (CSW) of Equation (B2) using the same group of variables as in equation (7) are presented in Table 8. As shown in the table, the impact of M&E capital on TFP is positive and statistically significant. The CSW estimation of the long-run elasticity of the Canada-U.S. relative TFP level to the relative M&E capital intensity is 0.19, which is larger than the SUR estimation of 0.13 (Table 6). The CSW estimation of the impact of skills is quite dramatic; the corresponding long-run elasticity is 0.54. In contrast, the SUR estimation for the impact of skills is close to zero. The impact of R&D is numerically very small in both sets of estimations. The long-run elasticity for ICT share in M&E capital is negative but very small (-0.01) in CSW estimation. The long-run elasticity for trade openness is 0.1 in CSW estimation and 0.06 in SUR estimation, implying than the trade openness has limited impact on the relative TFP level. Generally speaking, the two sets of estimations give more or less the same results for all independent variables considered except skills.

# **VECC INTERROGATORY #8**

# INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Pages 6-9, Para. 15-22

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: Para 15 states

"To estimate the Company's historical TFP trend an output quantity index is measured relative to an input quantity index. The output quantity index is created as a function of customer numbers residential/commercial volumes (RC) and other volumes"

- a) For a revenue cap formulation based on a revenue requirement per customer why, when estimating TFP, is an output index that includes RC volumes and other volumes appropriate? Please explain.
- b) For a pure RCI formulation based on a revenue requirement per customer, why is weather-related volumetric normalization a factor to be included in the output index?
- c) Calculate the EGD historical output quantity index for EGD on the same basis as Table 3, using only the number of customers (revenue per customer). Provide the corresponding TFP index assuming the same input quantity formulation as Table 4.
- d) Provide a side by comparison of the PEG and EGD calculated EGD Output Quantity index based on Table 3. Include all relevant references
- e) Why is fuel/power cost not a significant input cost for a gas distribution utility? Indicate the relative importance of this compared to labour and capital.
- f) Please provide details of calculation and all data used to recalculate EGD's Input Quantity Index in Table 4. Provide all relevant references
- g) Provide a side-by-side tabulation of PEG and EGD calculated Input Quantity Indices.
- h) Provide a comparison of the EGD and PEG Historical TPP Indices based on Table 5. Provide all relevant references.

# <u>RESPONSE</u>

a) An output index that includes RC volumes and Other Volumes is important to any measurement of TFP since a change in volumes has an impact on the Company's costs. Furthermore, the Company is not advocating the use of a volumetric balancing account. Therefore, changes in volumes are important in determining the rate of output growth to the rate of input growth, which is the definition for the TFP.

Witness: M. Lister

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 8 Page 2 of 7

- b) Weather-related volumetric normalization is important in order to isolate the impact that changes in weather may have on volumetric demand.
- c) Using only the number of customers to derive the fixed output quantity index as per Table 3 yields an output quantity index that is the same as the customer quantity sub-index, since by definition its revenue share weight is allocated 100%. Using the corrected input quantity index from Table 4, the measured TFP would be 1.14% (3.27 2.13).

Since the Company is not advocating the use of a balancing account, it is not relevant to consider an output quantity index which excludes other important revenue factors (i.e., volumes). Further, as stated above, excluding revenues from the calculation of TFP is to ignore a key factor in the determination of cost, and therefore, cannot accurately reflect TFP.

d) The table below provides the side by side comparison of PEG and EGD output quantity indexes.

Witness: M. Lister

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 8 Page 4 of 7

e) As PEG accurately states at page 22 of their June 2007 report:

The cost of **natural gas** used in system operation was itemized only by Union, which operates numerous compressors on its transmission and storage system. Enbridge and most U.S. gas utilities consume much less gas in system operation. The weight assigned to gas in their input price and quantity indexes was, accordingly zero.

As PEG indicates, the relative importance of this cost relative to labour and materials is negligible.

f) The tables below provide details on the calculation of the input quantity index.

The labour cost index was calculated according to the definition set out by PEG at page 21 of their June 2007 report:

The cost of **labour** was defined as the salaries and wages that contributed to net O&M expenses plus all expenses for pensions and other benefits. *Net* rather than gross salaries and wages are required to avoid double counting labour expenses that utilities capitalize.

The labour price index was calculated according to the definition set out by PEG at page 28 of their June 2007 report:

Each quantity subindex for labour was calculated as the ratio of salary and wage expenses to a labour price index. For the Ontario utilities we used as a labour price deflator an Ontario construction worker salaries and wages index.

And then further, on page 50:

In the input price trend comparisons, the price sub-index for labour was a Stats Canada index of Ontario construction worker *total* compensation.

The non-labour cost index was calculated according to the definition set out by PEG at page 22 of their June 2007 report:

The cost of **M&S** inputs was defined to be applicable O&M expenses net of expenses for labour and (in the case of Union) natural gas...The M&S expenses of Enbridge and Union were reduced further by the reported demand-side management expenses of the companies.

And then further, on page 50:

The price subindex for other O&M inputs was the Ontario GDPIPI for all goods and services.

Witness: M. Lister

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 8 Page 5 of 7

The capital cost index was calculated according to the definition set out by PEG at page 23 of their June 2007 report:

The capital service price indexes include, for both approaches to capital costing, terms for opportunity cost (return to debt and equity holders) and depreciation. The capital service price trend is thus a function of trends in construction costs, depreciation rates, and the cost of acquiring funds in capital markets.

# And then further, on page 75:

The capital quantity index in the base year is the inflation adjusted value of net plant in that year. We calculated this by dividing the net plant (book) value by an average of the values of a construction cost index for a period ending in the benchmark year...The construction cost index used in the Ontario calculations was, as noted above, a deflator for Canada's gas distribution capital stock prepared by Stats Canada.

Then, using the GD formulas presented by PEG at page 75 and 76 of their report the resulting capital indexes were calculated.

Since cost equals price multiplied by quantity, the input quantity is inferred by the ratio of the total cost to the price index. The following table illustrates the calculation of the labour, non-labour, and capital sub-index calculations.

	<u>Labour Cost</u> <u>Index</u>	<u>Labour Price</u> <u>Index</u>	<u>Labour</u> <u>Quantity</u> <u>Sub-Index</u>	Non-Labour Cost Index	Non-Labour Price Index	Non-Labour Quantity Sub-Index	Capital Cost Index	Capital Price Index	Capital Quantity Index
	Net S&W + Total Benefits + Total Pensions	Ontario Construction Labour Total Compensation		Net Utility O&M - Total Labour Cost - DSM	Ontario GDPIPI				
2000	1.00	1.00	1.00	1.00	1.00	1.00	1.00	0.09	1.00
2001	1.01	1.02	0.99	1.10	1.01	1.09	1.26	0.11	1.01

2005	1.13	1.15	0.98	1.40	1.08	1.29	1.13	0.09	1.07
2000-2005	2.48%	2.80%	-0.32%	6.73%	1.59%	5.14%	2.40%	1.07%	1.33%

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 8 Page 6 of 7

The cost shares for each sub-index were then calculated according to each sub-indexes proportion of the total cost. Multiplying the growth for each sub-index by its relative cost weight then yields the input quantity growth profile, which is converted into an input quantity index, as demonstrated in the table below.

		Labour	Non-	<u>Non-</u> Labour			<u>Input</u>	<u>Input</u>
	<u>Labour</u>	Quantity	Labour	Quantity	<u>Capital</u>	<u>Capital</u>	Quantity	Quantity
	Share	Growth	Share	Growth	Share	Growth	Growth	Index

### **VECC INTERROGATORY #9**

### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Page 11, Chart 1

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: Dr. Bernstein has criticized PEG's overall US sample for its weighting toward southern utilities and suggested a Northeast utility sample would be more appropriate.

- a) In reference to Chart 1, how many utilities are in the DRA Northeast Group. Please list them and their primary relevant metrics.
- b) Provide the statistics (Std. Dev. and t-statistic) for the TFP Index for the DRA Northeast Group.
- c) Discuss and compare PEG's EGD peer group to the DRA Northeast Group.

### RESPONSE

a) Apart from certain documents that Southern California Gas Company has posted on its website (namely Dr. Lowry's testimony as originally filed (available at <a href="http://www.socalgas.com/regulatory/grc/index.shtml">http://www.socalgas.com/regulatory/grc/index.shtml</a>), Dr. Lowry's workpapers (available at <a href="http://www.socalgas.com/regulatory/grc/workpapers.shtml">http://www.socalgas.com/regulatory/grc/errata.shtml</a>)), Attachments B and F are the entirety of the information from the California proceeding that is in Dr. Carpenter's possession.

It appears from Attachment F, page 40-5 there are 14 companies in DRA's Northeast Group: Boston Gas, Central Hudson Gas & Electric, Connecticut Natural Gas, Keyspan Energy, Niagara Mohawk, New Jersey Natural Gas, Nstar Gas, Orange & Rockland, PECO Energy, Peoples Natural Gas, Public Service Electric & Gas, Rochester Gas and Electric, Southern Connecticut Gas, and Baltimore Gas & Electric. Dr. Carpenter will be able to verify whether this is correct once DRA's workpapers have been provided by PEG in response to EGDI's Interrogatory #17, e). The relevant metrics in Dr. Carpenter's possession are provided in Table 4 on page 23 of his August 2, 2007 report (note that metrics for Boston Gas and Keyspan Energy are provided together as part of the "Keyspan" row.)

Witness: P. Carpenter

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 9 Page 2 of 2

- b) Dr. Carpenter does not possess this information. He anticipates that it might be provided as part of DRA's workpapers, which were requested in EGDI's Interrogatory #17, e) to PEG.
- c) PEG's EGD peer group using COS capital costing contains two companies that are also in DRA's Northeast group: Nstar Gas and Niagara Mohawk. PEG's EGD peer group using GD capital costing contains one company that is also in DRA's Northeast group: Nstar Gas. Relevant metrics in Dr. Carpenter's possession for PEG's EGDI peer groups are provided in Table 1 on page 9 of his August 2, 2007 report. Dr. Carpenter will not be able to respond further until PEG's interrogatory responses, model, and data are provided.

Witness: P. Carpenter

Page 1 of 2

### **VECC INTERROGATORY #10**

### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Page 12, 13, Paras 26-30

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: Dr Bernstein and EGD criticize PEG's Econometric model.

a) What specific components of the model are of concern? Please be specific and provide relevant references.

b) What methodological approach(es) do Dr. Bernstein and EGD suggest to replace/modify PEG's Econometric Modeling approach? Please be as specific as possible and provide relevant references.

# **RESPONSE**

- a) Dr. Bernstein's specific concerns regarding PEG's econometric model are fully discussed on pages 30-43 of his evidence. The specific problems center on the following issues;
  - The model involves the specification of a constrained or truncated translog cost function, as opposed to a complete translog cost function. PEG did not provide any statistical tests to justify whether or not the imposed (parameter) constraints are justified.
  - 2) The model generally assumes that all 36 firms in the sample have the same cost function. In particular, PEG assumes that all of the firms exhibit the same rate of technological change. PEG did not provide any statistical tests to justify whether or not firms actually have distinct cost functions.
  - 3) PEG did not examine the technical conditions of its estimated cost function, which any typical cost function must satisfy. For example, a cost function must be "concave" in the prices of the factors of production; that is the prices of capital, labor, and M&S inputs. Failure of this condition to hold implies that the estimated cost function is consistent with cost maximization and not cost minimizing behavior. Cost minimization is an assumption which forms the foundation of the model.

Witness: J. Bernstein

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 10 Page 2 of 2

- 4) PEG assumes that firms do not incur costs associated with the adjustment of their capital inputs. For example, PEG dos not include the critical costs associated with the process of installing capital inputs, which render these inputs capable of delivering services to customers. In addition, PEG assumes that capital is reversible; that there are no costs to "disinvesting". Thus PEG assumes that capital can be added and shed freely like non-capital inputs. This assumption has been rejected in regard to many capital-intensive industries. PEG does not provide any statistical tests justifying its assumption.
- 5) There are numerous measurement issues (discussed in Section 4 of Dr. Bernstein's evidence). For example, the measurement of the capital input price is a critical variable in the model. Changes in the calculation of this price often generate significant modifications to the estimation results.
- b) In Dr. Bernstein's opinion the components of the X factor should be based on agreed-upon index number calculation, and not on the estimates from PEG's econometric model. These issues are discussed in Section 3 of Dr. Bernstein's evidence. If econometric modeling techniques are to play any role in the formulation of an X factor, the data, programming code and all related worksheets must be made available to all parties to the process in order for the results to be auditable and critically evaluated.

Witness: J. Bernstein

### **VECC INTERROGATORY #11**

### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Pages 14, Para 32-36

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: The Brattle Group concludes that the U.S. Northeast is the most applicable region for peer group representation for EGD.

- a) Provide the complete analysis that underlies this conclusion in terms of the comparators used and the significance/weighting of each.
- b) In reference to Table 6, please provide all the significant metrics of the proposed peer group.
- c) Discuss and compare this peer group to the PEG peer group and to PEG's total U.S. Sample.

# **RESPONSE**

- a) Dr. Carpenter cannot provide a complete analysis until PEG's interrogatory responses, model, and data are provided. His initial analysis is provided on pages 19-20 and 21-23 of his August 2, 2007 report.
- b) Dr. Carpenter cannot provide a complete analysis of all significant metrics until PEG's interrogatory responses, model, and data are provided. His initial analysis is provided in Table 4 on page 23 of his August 2, 2007 report.
- c) PEG proposes two peer groups for EGDI: a peer group if GD capital costing is used (made up of Washington Gas Light, East Ohio Gas, Pacific Gas & Electric, Northern Illinois Gas, Southern California Gas, Mountain Fuel Supply, Southwest Gas, and Nstar Gas) and a peer group if COS capital costing is used (made up of Washington Gas Light, East Ohio Gas, Pacific Gas & Electric, Northern Illinois Gas, Southern California Gas, Mountain Fuel Supply, Nstar Gas and Niagara Mohawk). PEG's EGD peer group using COS capital costing contains two companies that are also among the Northeast utilities listed in Table 4 of Dr. Carpenter's August 2, 2007 report: Nstar Gas and Niagara Mohawk. PEG's EGD peer group using GD capital costing contains one company that is also among the Northeast utilities listed in Table 4 of Dr. Carpenter's August 2, 2007 report: Nstar Gas. Dr. Carpenter will not

### **VECC INTERROGATORY #13**

### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 3, Schedule 1, Pages 36, Para 87-89

Issues: 3.1 How should the X factor be determined?

3.2 What are the appropriate components of an X factor?

Preamble: EGD Compares its RCI estimate to historic revenue requirement from 1994-2006.

a) Update Table 13 to include the 2007 approved distribution revenue requirement. Provide the average, mean and Standard deviation of the revenue growth.

b) Provide a version of Table 13 that uses EGD's proposed GDPIPI-X formulation to produce an annual revenue requirement (1994-2007). If an estimate of Y factors is available this should be shown in a separate column. Provide appropriate statistics and explanatory notes.

# <u>RESPONSE</u>

a) The updated table is presented below, which includes the 2007 approved revenues. The average (or mean) and the standard deviation of revenue growth are shown for both the 1994 to 2007 period and the 1994 to 2007 period excluding the 2004 Test Year, which set revenue according to a temporary measure.

		Approved Revenues	Annual Revenue
	<u>Year</u>	(\$000)	Growth

b) In order to equally compare the two X-Factor estimates requires one to hold the formulaic methodology constant in order to isolate the impacts of the proposed X- Factor adjustment. The evidence, at paragraph 72 of Exhibit B, Tab 3, Schedule 1, established comparability by using PEG's methodology to examine the adjustment to the Company's revenue requirement. PEG's methodology consists of adding back to the RCI the estimated elasticity-weighted output index to derive the ultimate RCI. Table 12, at paragraph 87 of the evidence, shows the effects of this adjustment to the RCI using each of PEG's and the Company's calculations.

The Company's proposal is to establish *unit rates* by escalating the per customer revenue requirement by (I-X), multiplying by test year customers and dividing by test year volumes. Both test year volumes and customers would be determined in an annual hearing, and subject to intervenor scrutiny. Below, the relative affects of the X-Factor adjustments are compared on the basis of the Company's proposal.

The table below shows the historical unit growth rates resulting from the historical approved revenues, budget customer additions, and budget volumes.

		<u>Approved</u>			<u>Budget</u>		<u>Unit</u>
		Revenues	<u>Budget</u>	Customer	Volumes	Unit Rate	<u>Rate</u>
	<u>Year</u>	<u>(\$000)</u>	<u>Customers</u>	<u>Additions</u>	$(10^3 \text{m}^3)$	$($/10^3 \text{m}^3)$	<u>Growth</u>

RP-2003-0203 FINAL	2005	908,449	1,718,766	42,386	12,298,030	73.87	-1.66%
EB-2005-0001 FINAL	2006	950,014	1,792,615	73,849	12,289,778	77.30	4.65%
EB-2006-0034 INTERIM	2007	987,052	1,823,258	30,643	11,776,341	83.82	8.43%
Average 1994-2007				50,096			3.00%
Average 1994-2007 (Ex. 2004)				49,159			3.12%

To calculate the comparable unit rate impacts requires estimates for customer growth and volumetric growth. The historical trend in volumetric growth over the period 1994 to 2007 was 0.85%. The average customer additions over the period 1994 to 2007 were 50,096. Adding the average customer additions to the 2007 total customers and calculating the growth rate results in a customer growth rate of 2.75%. The table below calculates the equivalent unit rate growth impacts using the Company's proposed methodology. An explanation of the calculations follows.

#### **Equivalent Unit Rate Growth Proposals**

	<u>PEG</u> (March 2007)	<u>PEG</u> (June 2007)	<u>Enbridge</u> <u>Gas</u> <u>Distribution</u>
	<u>GD</u>	<u>GD</u>	<u>GD</u>
GDPIPI <sup>1</sup>	1.61	1.61	1.61
X-Factor	0.30	2.25	-0.77
Output <sup>elasticity-weighted</sup>	2.57	2.74	0.00
Annual Budget Customer Growth <sup>2</sup>			2.75
RCI	3.87	2.09	5.19
Annual Budget Volume Growth <sup>3</sup>	0.85	0.85	0.85
Unit Rate Growth	3.00	1.23	4.30

<sup>1.</sup> Trend growth for the period 1994-2006, 2007 data not available.

EGD's RCI = (1+GDPIPI-X)\*(1+Customer Growth) - 1 EGD's Unit Rate Growth = (1+RCI) / (1+Volume Growth) - 1

Witnesses: K. Culbert

<sup>2.</sup> Calculated as average customer additions relative to 2007 budget, will be subject to intervenor scrutiny on an annual basis.

<sup>3.</sup> Trend growth for the period 1994-2007, will be subject to intervenor scrutiny on an annual basis.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 13 Schedule 13 Page 4 of 4

PEG's RCI =  $(1 + GDPIPI - X + Output^{elasticity-weighted}) - 1$ PEG's Unit Rate Growth = (1+RCI) / (1+Volume Growth) - 1

Since the Company proposes to adjust rates according to volumetric growth, it is necessary to divide the RCI by volumetric growth to derive the unit rate growth.

With equivalent unit growth rates established, the Company can isolate and examine the X-Factor impacts on the total formula and compare the estimates relative to historical unit rate growth.

It can be seen that using PEG's June 2007 methodology results in unit rates that were less than the historical growth in 9 of 13 years, or 69.2% of observations (9 of 12 years excluding 2004, or 75.0% of observations).

Conversely, it can be seen that using the Company's methodology results in unit rates that were less than the historical growth in 5 of 13 years, or 38.4% of observations (5 of 12 years excluding 2004, or 41.6% of observations).

Witnesses: K. Culbert

### **VECC INTERROGATORY #14**

### INTERROGATORY

Reference: Enbridge Exhibit B, Schedule 1, Tab 1 Page 1, Para. 19-Issue 4.1: Is it appropriate to include the impact of changes in average use in the annual adjustment?

Preamble: "It is essential that the IR Plan provide appropriate mitigation from the impact of the decline in average use on utility earnings".

- a) Confirm that under a revenue cap, as proposed by EGD, the test year revenue requirement is based on the number of customers <u>not</u> volume per customer.
- b) Confirm that under EGD's proposed IR mechanism, the allocation of the revenue requirement to customer classes is based on a volume forecast (or forecast with true-up?) to produce unit rates.
- c) What approach does EGD propose to address declining Normalized Average Use per Customer under the IRM? Contrast this with the current approach based on EGD's econometric models.
- d) Does EGD propose a true-up for forecast-actual volumes and if so, what process will be used under the proposed rate filing process and reporting requirements [B-6-1]. If not, why not-explain.
- e) Does EGD agree/disagree (plus explanations) with the following of PEG's statements:
  - i. "For the RCI, a balancing account would ensure that the allowed revenue requirement is exactly recovered and, therefore an AU factor is not required." [D-T3-S1, P11]; and
  - ii. "If the revenue requirement is allocated, and rates are designed by traditional means, there is no need for AU or ADJ terms in the X factor formula." [D-T3-S1, P 12]; and
  - iii. "A revenue cap index (RCI) caps the growth in a company's revenue requirement. Such an index is commonly paired with a balancing account that ensures that the revenue requirement is ultimately recovered. This tandem of IR plan provisions provides automatic compensation to the utility for declines in average use. The ratepayer therefore absorbs the risk of average use trends" (emphasis added). [D-T3-S1 Pages 14-15]
- f) Has EGD considered a "balancing account" as suggested by PEG. If so what would be covered, for example normalized volumes or total volumes. Please explain.

# <u>RESPONSE</u>

- a) The escalation formula, which can be found at Exhibit B, Tab 1, Schedule 1 escalates the base year revenue requirement per customer by GDPIPI-X. Once the escalated revenue requirement per customer is attained, this is multiplied by the forecast number of customers to obtain the test year revenue requirement.
- b) Confirmed.
- c) As explained above, the Company will file a volume forecast in each year of the IR Plan. The forecast would include any impacts of the decline in average use in general service classes and any reductions in volumes by large commercial and industrial customers.
- d) The Company's proposal would function in a fashion similar to the current Cost of Service ("COS") model of rate setting with annual volume forecast. Under the COS model, the Company's shareholders at risk for the accuracy of the Company's volume forecast. The Company does not propose to transfer this risk to ratepayers through a true-up mechanism.
- e) The Revenue Cap model contemplated by PEG in its evidence does not contemplate annual application by the utility for approval of its volume forecast for the next year as proposed by the Company. The balancing account discussed by PEG would therefore not be needed under the Company's RCPC proposed model.
- f) Please see the response to (e) above.

### **VECC INTERROGATORY #16**

# **INTERROGATORY**

Reference: Enbridge Exhibit B, Tab 1, Schedule 1, Pages 19-20, Para 48-49

Issue 8.1: What is the appropriate plan term for each utility?

Preamble: EGD has rejected a symmetric ROE-based Off-ramp

a) What is EGD's position on a mid-term review and if one was ordered by the Board, what would be the scope of any such review?

b) What would EGD propose as the financial parameters that would determine if an off ramp was appropriate and how would these apply to the proposed RCI formulation?

# **RESPONSE**

- a) In the evidence, the Company proposes a mid term review for the purpose of considering if the incentive regulation plan should be renewed or extended. See Exhibit B, Tab 1, Schedule 1, page 18, paragraphs 43-45.
- b) In the evidence, the Company proposes that it will make application to the Board for return to cost of service regulation if there are significant and unexpected developments that threaten the sustainability of the plan and the Board will determine if an off ramp is appropriate. See Exhibit B, Tab 1, Schedule 1, pages 19 to 20, paragraph 46.

# **VECC INTERROGATORY #17**

### INTERROGATORY

Reference: Specific references as noted

Issues: 10.1 Should an ESM be included in the IR plan? 10.2 If so, what should be the parameters?

- a) Provide a clear explanation of EGDs position on Earnings Sharing with appropriate supporting references.
- b) Confirm that the Econanalysis (sic) Survey provided as Exhibit D-T5-S1 in Appendix 1 shows that of the 15 PBR/IRM schemes reviewed 12 have some form of earnings sharing or over/under earnings adjustment.
- c) Since EGD is using the Econanalysis (sic) Survey as support for a revenue cap vs rate cap. Comment on the inclusion/exclusion of ES for each type of IRM.
- d) <u>If</u> EGD was requested by the Board to propose an earnings sharing /over/under earnings adjustment, outline the parameters of its proposal (for example symmetric/asymmetric, deadband etc.)

# **RESPONSE**

EGD is generally opposed to earning sharing because it dilutes the incentive power of the plan. This position was recognized by the Ontario Energy Board in the Natural Gas Forum Report which states that "the Board views the retention of earnings by a utility within the term of an IR plan to be a strong incentive for the utility to achieve sustainable efficiencies"; and "the Board does not intend for earnings sharing mechanisms to form part of the IR plans." (p. 28). Consequently, earning sharing is not a feature of the Company's IR proposal.

Nevertheless, the Company recognizes that so called "over-earning" is a key sensitivity for stakeholders and the Company is prepared to consider an earning sharing mechanism in the context of negotiations for a complete settlement of the issues of this application.

### **VECC INTERROGATORY #18**

# **INTERROGATORY**

Reference: Enbridge Exhibit B, Tab 6, Schedule 1, Page 1, Para 1

Issue: 12.1 Annual Adjustment

12.1.1 What should be the information requirements

12.1.2 What should be the process, the timing, and the role of the stakeholders.

Preamble: "The devil is in the details"

- a) For the volume and customer forecasts- will year to date (Bridge year) information be provided.
- b) Compare the degree day/ volume forecast filing to the 2007 rate case filing in terms of a list of the Exhibits/Tabs to be provided.
- c) What process does EGD propose for regulatory review of forecasts for example IR's, Technical Conference(s)?
- d) Why would not EGD use historic year volumes combined with a balancing account?
- e) What other Cost of Service reviews are proposed for example Capital programs/projects, DSM Budgets deferral and variance accounts.
- f) Indicate relative to the 2007 rate case filing, the extent of evidence to be provided and the proposed regulatory process.

### RESPONSE

- a) Reference Exhibit B, Tab 7, Schedule 1, paragraph 3 The 2012 Bridge Year information would be filed with some combination such as 0+12, or 'X' months of actual + 'Y' months of forecast, such that X+Y = 12, dependent upon the currency of information available at the time of the development of the evidence relative to the expected timing of the evidentiary filing.
- b) Reference Exhibit C, Tab 2, Schedule 1 2008 Gas Volume Budget This evidence contains approximately 25 pages of narrative which provides detailed explanations for the development of the 2008 volume budget and variance explanations to previous volume budgets and forecasts. There are also approximately 26 pages of numeric exhibits provided as Appendix A to that exhibit

Witnesses: R. Bourke

which provide a similar series of numeric exhibits to the exhibits that were filed in the 2007 Test Year (EB-2006-0034) proceeding at the following exhibit references:

a. C1-3-1
b. C3-T2, S1 to S4
c. C4-T2, S1 to S4
d. C5-T2, S1 to S7
2007 Gas Volume Budget;
2007 Budget Cust's, Vol's & Rev's;
2006 Bridge Cust's, Vol's & Rev's; and
2005 Actual Cust's, Vol's, Rev's and Avg Use

- c) Reference Exhibit B, Tab 6, Schedule 1 The Company's IR proposal for the annual setting of rates can be found at Exhibit B-6-1.
- d) The Company's proposed IR model does not include a balancing account. Please refer to the response filed to Board Staff Interrogatory #2 at Exhibit I, Tab 1, Schedule 2.
- e) The Company's IR proposal includes the following submissions:
  - a. Reference Exhibit B, Tab 4, Schedule 1 Capital programs/projects this evidence outlines the Company's requested Y Factors related to capital investments. The amounts related to these Y Factors will be submitted, when available, at Exhibits C-7-2 through C-7-5. This evidence would be reviewed on a cost of service recovery basis.
  - b. Reference Exhibit B, Tab 4, Schedule 2 and Exhibit I, Tab 13, Schedule 15, part d) DSM Budgets In its Decision in EB-2006-0021, The Board approved Enbridge's DSM operating budgets to be \$22.0 million for 2007, \$23.1 million for 2008, and \$24.3 million for 2009. The Company expects to participate in a second generic gas DSM proceeding at some point prior to the 2010 year in order for the Board to rule on the DSM program beyond the 2009 year. The Company anticipates that the DSM issue will be reviewed outside this and future IR proceedings.
  - c. Reference Exhibits B-5-1 and I-1-15 Deferral ("DA") and Variance ("VA") Accounts the Company has proposed to file a combination of actual DA and VA balances plus a forecast to year end in order to generate an "8+4" forecast balance for review in the expected annual rate setting process for the 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> and 5<sup>th</sup> years of the proposed IR plan term. As stated in the referenced evidence and interrogatory response, this submission is

### **VECC INTERROGATORY #19**

### INTERROGATORY

Reference: Enbridge Exhibit B, Tab 6, Schedule 1, Page 1, Para 1

Issues: 14.1 Are there adjustments that should be made to base year revenue requirements and/or rates?

14.2 If so, how should these adjustments be made?

- a) List all components and amounts of the 2007 revenue requirement that could change by virtue of Settlement Agreements (e.g. DSM, Envision, CIS/Customer Care, Open Bill Access)
- b) In EB-2006-0034 Phase II, Stock Based Compensation and Equity Financing are issues to be determined by the Board as to whether these are legitimate costs to be borne by EGD ratepayers. If the Board finds they are not, what would be the corresponding adjustment to the 2008 revenue requirement. Respond for each cost category.
- c) Does EGD have information and estimates on its proposed 2008 Y factors? If not when will this be available?

# **RESPONSE**

- a) Please reference to Exhibits B, Tab 1, Schedule 28 and Exhibit C, Tab 4, Schedule 1.
- b) The ADR agreement filed in EB-2006-0034 at Exhibit N1-1-1, issue 3.7, on pages 23 and 27 of 47, states that "Parties agree to the overall level of this budget, but there is no specific agreement as to the amounts of each of the individual allocations". The Company is of the opinion the amount of \$18.1 million was agreed to by all parties and was used to determine the total 2007 revenue requirement and rates. Enbridge Gas Distribution is not seeking to change the Board approved 2007 rates in this proceeding and therefore there would be no adjustment to the 2008 revenue requirement.
- c) The Company's submissions related to Y factors are as follows:

a. Capital related Exhibit B-4-1 Filed 2007-08-02;
b. Others Exhibit B-4-2 Updated 2007-09-04;
c. Rev. Requirement Exhibit C-4-1 Filed 2007-09-04; and
d. Cost Recovery Exhibits at C-7, Schedules 1 – 5 than 2007-09-25.

# VECC AND CCC INTERROGATORY #1

### INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, page 4, please provide a document that describes the method used to determine the TFP estimates shown in the Table 1.

# **RESPONSE**

Updated CSLS data is available at SEC Interrogatory #30, which can be found at Exhibit I, Tab 11, Schedule 30.

The Company does not have access to the methodology used by the CSLS to determine the TFP estimates.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 2 Page 1 of 1

# **VECC AND CCC INTERROGATORY #2**

### INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, paragraph 19, are all of the DSM programs used only by non-residential and non-commercial customers?

# <u>RESPONSE</u>

DSM programs apply to both residential and commercial customers. As stated in paragraph 19, the Company's aim was to replicate PEG's process as closely as possible. Unfortunately, an exact match could not be determined, however, the closest result was yielded by the formulas expressed in that paragraph, and reproduced below.

R/C volumes = (Rate 1 normalized + Rate 6 normalized + Rate 100 un-normalized) Other volumes = (Total actual volume - Rate 1 actual - Rate 6 actual - Rate 100 actual + DSM volumes)

The results of this attempt at replication are detailed in the table below.

	<u>Total</u>		
	<b>Estimated</b>		
	<u>PEG</u>	Total PEG	
	Replication	Reported	<u>Ratio</u>
2000	11,775	11,784	100.07%
2001	11,758	11,652	99.10%
2002	11,649	11,708	100.50%
2003	12,421	12,210	98.30%
2004	12,257	12,155	99.17%
2005	12,214	12,124	99.26%

The relative weight of the DSM volumes to the total volumes is less than 1%. It is hoped that more clarity on PEG's output quantity index creation process will become available either through the current interrogatory phase or through a subsequent technical conference.

# **VECC AND CCC INTERROGATORY #4**

### INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, paragraph 19, provide the Excel spread sheet that shows the calculation of the revenue weights.

# <u>RESPONSE</u>

Please see response to VECC Interrogatory #8, part d) at Exhibit I, Tab 13, Schedule 8. In that response the table shows the calculation of the PEG replicated output quantity indexes, and the weights that were determined by Excel's Solver tool such that the Fixed Revenue Output index was the same as that produced by PEG.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 5 Page 1 of 1

# **VECC AND CCC INTERROGATORY #5**

# **INTERROGATORY**

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, table 3, is it your understanding that the only for the differences between the R/C volumes shown in this table and the R/C volumes shown in the PEG Study table 7 is due to different heating degree day adjustments? If not, please explain what other adjustments could have caused differences in those estimates?

# **RESPONSE**

It is the Company's understanding that the differences between RC volumes for PEG and EGD are due to heating degree day adjustments.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 6 Page 1 of 1

# **VECC AND CCC INTERROGATORY #6**

# **INTERROGATORY**

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, table 3, what is your understanding of the cause of the difference between the other volumes shown in this table and the other volumes reported in the PEG Study table 7.

### **RESPONSE**

The Company did its best, without a technical conference or interrogatory phase, to replicate the volumetric data provided by PEG. As stated in CCC-VECC Interrogatory #2, the closest solution the Company could determine was a result of the equations listed in paragraph 19 of the PEG study and again in response to CCC-VECC Interrogatory #2 at Exhibit I, Tab 14, Schedule 2.

It is hoped that more clarity on PEG's processes will become available either through the current interrogatory phase or through a subsequent technical conference.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 7 Page 1 of 1

# VECC AND CCC INTERROGATORY #7

### INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, table 4, what is your understanding of the cause of the fact that the labor subindex declines in your table while it increases in the PEG study table 6.

### <u>RESPONSE</u>

A detailed explanation for the creation of the input quantity index, including each of the relevant sub-indexes is provided in the response to VECC Interrogatory #8, part f), and a comparison to PEG's input quantity index is provided in part g) at Exhibit I, Tab 13, Schedule 8.

The Company was not able to reconcile PEG's calculations for the labour and non-labour quantity sub-indexes.

It is hoped that more clarity on PEG's processes will become available either through the current interrogatory phase or through a subsequent technical conference.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 8 Page 1 of 1

# **VECC AND CCC INTERROGATORY #8**

# INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, table 4, please provide the weights used to determine the input quantity index. Provide all workpapers and documents used to determine the weights.

### <u>RESPONSE</u>

The weights were calculated as each cost's share of the total cost. The calculated weights can be found in the response to VECC Interrogatory #8, part f) at Exhibit I, Tab 13, Schedule 8.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 9 Page 1 of 2

### **VECC AND CCC INTERROGATORY #9**

### INTERROGATORY

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, paragraph 19, provide the Excel spread sheet that shows the calculation of the cost weights and the cost based TFP estimate of 0.31%.

# **RESPONSE**

Based on the corrected evidence, filed as Exhibit B, Tab 3, Schedule 1, the updated cost-based TFP estimate is 0.22%.

As stated at paragraph 23 of the evidence, the weights used to derive the cost-weighted TFP were determined using PEG's table and Excel's Solver tool, such that applying the data used by PEG for customers and volumes yielded the same cost-weighted output growth profile.

Similar to the response for VECC Interrogatory #8, part d) at Exhibit I, Tab 13, Schedule 8 the details of the Solver-determined weights and the calculation of the cost-weighted output quantity index are found in the table below.

The cost-weighted TFP is then calculated as the cost-weighted output quantity index less the input quantity index, as shown in the table below.

	Cost-Weighted Output Quantity	<u>Input</u> Quantity	<u>Cost-</u> Weighted
	Index	Index	TFP Index
Year			
2000	1.000	1.000	1.000
2001	1.015	1.026	0.989
2002	1.046	1.020	1.025
2003	1.061	1.081	0.982

### VECC AND CCC INTERROGATORY #10

# **INTERROGATORY**

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, paragraph 37, Enbridge states that it agrees with the PEG Study use of the Canadian aggregate business sector MFP to measure the economy-wide TFP. In Enbridge Tab 3, Schedule 1, paragraph 1, this value is reported as 0.72, while the PEG study uses a value of 1.21 for this variable. Please explain the difference between the two estimates.

# <u>RESPONSE</u>

The difference is due to differences in sample periods used. Please see the response to VECC Interrogatory #6, part a) at Exhibit I, Tab 13, Schedule 6.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 11 Page 1 of 1

# VECC AND CCC INTERROGATORY #11

# **INTERROGATORY**

Issue Number: 3.1

Issue: How should the X factor be determined?

With regard to Enbridge Tab 3, Schedule 1, paragraph 44, Enbridge states that it agrees with the PEG Study method to determine economy wide input prices. In Enbridge Tab 3, Schedule 1, paragraph 1, this value is reported as 2.49, while the PEG study, table 16, uses a value of 2.99 for this variable. Please explain the difference between the two estimates.

# **RESPONSE**

The difference is due to differences in sample periods used. Please see the response to VECC Interrogatory #6, part a) at Exhibit I, Tab 13, Schedule 6.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 13 Page 1 of 1

### **VECC AND CCC INTERROGATORY #13**

# **INTERROGATORY**

Issue Number: 3.2

Issue: What are the appropriate components of an X factor?

With regard to Enbridge Tab 3, Schedule 3, header page 4, has Dr. Bernstein performed any study that would indicate that there is intensifying decline in percustomer usage? If so, please provide that study? Has Dr. Bernstein performed any that would indicate that the decrease in per-customer usage is unrelated to DSM programs? If so, please provide that study. If Dr. Bernstein possesses a study that demonstrates that the decline in Enbridge's per-customer usage is intensifying, please provide that study.

# RESPONSE

Dr. Bernstein has not performed any studies described in the foregoing interrogatory.

Witness: J. Bernstein

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 14 Page 1 of 1

# VECC AND CCC INTERROGATORY #14

### INTERROGATORY

Issue Number: 3.2

Issue: What are the appropriate components of an X factor?

With regard to Enbridge Tab 3, Schedule 3, header page 4, please describe the significant upgrades to infrastructure that Enbridge is experiencing. How long has Enbridge been investing in the upgrade? What percent of the upgrade is complete? What is the expected completion date of the program?

### **RESPONSE**

Please refer to SEC Interrogatories #1 and #2 at Exhibit I, Tab 10, Schedules 1 and 2, respectively.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 14 Schedule 15 Page 1 of 1

## **VECC AND CCC INTERROGATORY #15**

## INTERROGATORY

Issue Number: 3.2

Issue: What are the appropriate components of an X factor?

With regard to Enbridge Tab 3, Schedule 3, header page 5, has Dr. Bernstein performed any studies that indicate that future Enbridge investments will increase more rapidly than past trends indicate? If so, please provide the studies. If Dr. Bernstein possesses a study that demonstrates that Enbridge's investments will increase more rapidly than past trends indicate, please provide that study.

## <u>RESPONSE</u>

Dr. Bernstein has not performed nor possesses any studies mentioned in the foregoing interrogatory.

Witness: J. Bernstein

## CORAL ENERGY INTERROGATORY #1

## INTERROGATORY

1. Ref: EGD Exhibit 4, Schedule 1, Page 5, Page 7, Pages 13-15

Issue Number: 12.2.1/12.4.3

Issue: What should be the criteria to implement new energy and non-energy services?

- (a) Please provide any and all EGD and EI business plans, strategy documents, internal memos and related internal communications related to any new rates and services that EGD may propose over the term of the IR plan.
- (b) Please identify whether there is any intention to provide any new rates or services that include commodity bundled with storage and/or transportation services. If so, please indicate the basis upon which (cost-based, market based, or some variant thereof) storage will be charged to (each of in-franchise and exfranchise) customers who wish to purchase: (i) strictly storage or transportation from EGD; and (ii) storage or transportation from EGD and commodity from EGD (in which case please also identify how the commodity will be charged).
- (c) Please list any and all new services that you have considered or are considering implementing during the IR plan, including any services that assist customers in managing or balancing their supply and other related obligations and/or credit, if applicable.
- (d) Please provide the forecast revenue associated with each of the new services identified above for each year of the IR plan. Please provide any forecast profits to EI or EGD or any related entity associated with each of the new services identified above for each year of the IR plan.
- (e) Please indicate any and all EGD/EI affiliates and related entities that may be involved in the provision of any new services the EGD large industrial customers during the plan term.
- (f) To the extent possible at this time, please identify which Enbridge entities will be providing each of the contemplated new services.
- (g) Please indicate precisely how EGD intends to account for and remunerate any and all affiliates for any new services provided to large industrial customers

Witnesses: K. Culbert

P. Hoey

A. Kacicnik

T. Ladanyi

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 15 Schedule 1 Page 2 of 3 Plus Attachment

during the term of its proposed revenue cap IR.

- (h) In the event that EGD affiliates or related entities provide new services to EGD industrial customers during the plan term, how will such services be billed?
- (i) Please outline the detailed process that EGD will follow from: (i) the first internal intention to proceed with a new service; through to (ii) the latter of Board approval/EGD implementation of such new services. Please highlight how and when stakeholders and affected customers will be involved

## RESPONSE

- a) At the present time, the Company does not have any plans for new energy rates and services by Enbridge Gas Distribution.
  - Having said that, the Company is planning to propose a modification to its Rate 135: Seasonal Firm Service as part of its 2008 rate filing. This is being done to address Rate135 customers' preferences for gas supply arrangements. The modification would not impact the Company's other customers. A copy of the customer meeting presentation is attached. Please see Appendix A.
- b) The Company is going to monitor, throughout the IR plan term, if there is a need for new rates and services. Since the Board would be required to approve any new rates and services, Enbridge Gas Distribution will make an application for the new rates and services with appropriate supporting documentation.
- c) Please see response to question a).
- d) Please see response to question a).
- e) Please see response to question a).
- f) Please see response to question a).
- g) and h) Please see response to question a). Also, Enbridge Gas Distribution rates and services are provided by the Company under the Board-approved rate schedules/rate handbook. The Affiliate Relationship Code and associated affiliate service agreements govern services Enbridge Gas Distribution provides to/receives from its affiliates.

Witnesses: K. Culbert

P. Hoey A. Kacicnik T. Ladanyi

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 15 Schedule 1 Page 3 of 3 Plus Attachment

i) If the rate-related changes are minor in nature and customer impacts are minimal, the Company is proposing that the Board's approval process could be included as part of the annual rate setting filing. However, if the rate-related changes are significant and warrant a longer review period, the Company is proposing to file a separate rate change application. This approach reflects Board Staff's recommendation in its Discussion Paper (p. 20). Note that new rates and services could also be developed as part of a future generic proceeding initiated by the Board. In such a case the Board would approve new services following the conclusion of the generic proceeding.

The Company is going to consider the needs of customers/stakeholders in development of new rates and services. As it is the case today, this may be accomplished through customer/stakeholder meetings, annual large volume customer meetings, or a consultative process. Once the Board approves the new rates and services, the Company would communicate the changes to customers by letter and/or meetings. If the changes are significant, the Company could also hold special customer information and training sessions. The Company held such sessions following the Natural Gas Electricity Interface Review "NGEIR" generic proceeding to communicate to large volume customers the nature and characteristics of the newly developed unbundled rates and services to provide training to customers wishing to use unbundled services.

## Ontario Hot Mix Producers Association (OHMPA) Customer Meeting:

February 15, 2007

**Enbridge Gas Distribution** 

Filed: 2007-09-07 EB-20070-0615 Exhibit I

Tab 15 Schedule 1 Attachment Page 1 of 16

- Background
- OHMPA's Members' Preferences for Gas Possible Changes to R135 to Meet Supply Arrangements
- Feedback & Questions

Filed: 2007-09-07 EB-20070-0615 Exhibit I Tab 15 Schedule 1 Attachment Page 2 of 16

## Background

- deliveries on a 12-month Mean Daily R135 customers currently provide Volume (MDV) basis
- occurs through summer and fall (i.e. non-Most of R135 customers' consumption heating seasonal load profile)
- seasonal credits (which are based on MDV customers for winter MDV deliveries via deliveries from December to March) The Company compensates R135

Filed: 2007-09-07

Page 3 of 16

## Background

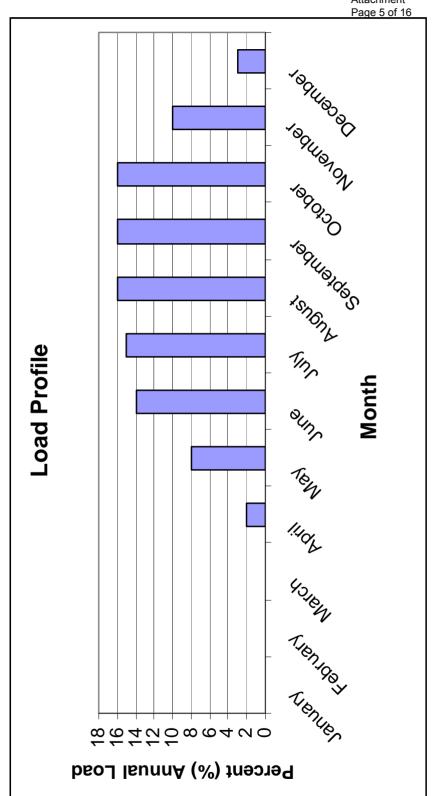

- account for a majority of R135 customers OHMPA represents asphalt plants which
- gas supply arrangements if they no longer would no longer receive seasonal credits) needed to deliver MDV in the winter (and would benefit from alternative / seasonal Some OHMPA members indicated they
- Company's unbundled rates but do not These members have reviewed the plan to use them

Filed: 2007-09-07

# OHMPA Members' Load Profile:

Filed: 2007-09-07 EB-20070-0615 Exhibit I Tab 15 Schedule 1 Attachment

# Possible Changes to R135

## Modified R135:

- 12 month contract
- Customers deliver a 9-month MDV based on their total annual load / volume requirement
- MDV = annual volume / 270
- Customers do not receive seasonal credits for the months of January through March
- **EnTRAC** modifications costly
- **Need to work around EnTRAC's existing** capabilities to devise a solution

Filed: 2007-09-07 EB-20070-0615 Exhibit I

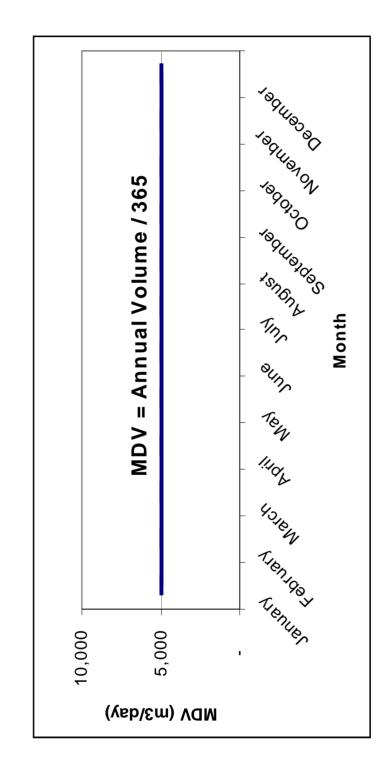

Tab 15 Schedule 1 Attachment Page 6 of 16

# Mean Daily Volume (MDV)

## • Currently MDV calculated as:

- Annual volume =  $1,825,000 \text{ m}^3$
- MDV = annual volume /  $365 = 5,000 \text{ m}^3$

Filed: 2007-09-07 EB-20070-0615 Exhibit I

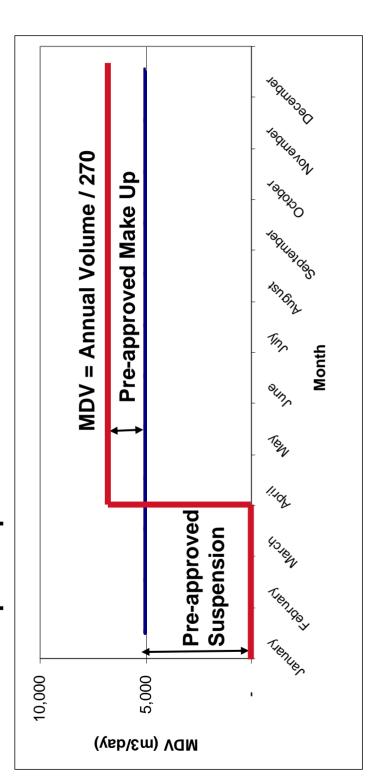

Tab 15 Schedule 1 Attachment Page 7 of 16

# **Mean Daily Volume (MDV)**

## Modified MDV calculated as:

- Annual volume =  $1,825,000 \text{ m}^3$
- Modified MDV = annual volume / 270 = 6,760 m<sup>3</sup>
- The difference vs. current MDV treated as pre-approved make-up / suspension in EnTRAC

Filed: 2007-09-07 EB-20070-0615 Exhibit I

Tab 15 Schedule 1 Attachment Page 8 of 16

# Mean Daily Volume (MDV)

- Balancing of Banked Gas Account (BGA)
- Title transfers (standard rules apply)
- suspension as per system allowances of the Rescind of the pre-approved make up or
- » Will require coordination with Account Executive and Contract Compliance

Filed: 2007-09-07 EB-20070-0615 Exhibit I

Tab 15 Schedule 1 Attachment Page 9 of 16

# Seasonal Overrun Charges

- R135 customers cannot use more than 5% of the annual contract volume in the months of December through March
- Any volume > 5% subject to seasonal overrun charges

Filed: 2007-09-07 EB-20070-0615 Exhibit I Tab 15 Schedule 1 Attachment Page 10 of 16

## Seasonal Credits

- receive seasonal credits for the month of **Customers using modified R135 will** December (as they will be delivering modified MDV through December)
- receive seasonal credits for the months of Customers using modified R135 will not January, February and March

Filed: 2007-09-07 EB-20070-0615

Page 11 of 16

## Pooling

## Pooling restrictions:

- each customer using modified R135 in a separate single-customer "pool"; or
- multiple-customer pool must contain only customers using modified R135

Filed: 2007-09-07 EB-20070-0615 Exhibit I Tab 15 Schedule 1 Attachment Page 12 of 16

# Upstream Transportation

- EGD contracts for upstream capacity on a 12-month basis
- Upstream capacity assignments also on a 12-month basis
- Customers with modified R135, who rely on upstream transport or capacity assignment from EGD, responsible for such costs on a 12-month basis

Filed: 2007-09-07 EB-20070-0615 Exhibit I

Tab 15 Schedule 1

Page 13 of 16

- Administration of modified R135 will require manual processing of some activities / transactions
- May need to charge a nominal fee to cover such costs

Filed: 2007-09-07 EB-20070-0615 Exhibit I

Tab 15 Schedule 1 Attachment Page 14 of 16

## Implementation

(Earliest) Implementation in 2008

Subject to OEB approval

## TRANSALTA INTERROGATORY #1

## <u>INTERROGATORY</u>

1. Ref: Enbridge Exhibit B, Tab 6, Page 2, Exhibit B, Tab 5, Page17, Exhibit B, Tab5, Exhibit B, Tab 4 and rate impact evidence

Issue Number: 1.1

Issue: What are the implications associated with a revenue cap, a price cap and other

alternative multi-year incentive ratemaking frameworks?

Preamble: A number of large natural gas consumers including electricity generators require detailed understanding of the potential changes in rates and services and the impacts of EGD's proposed IR plan in order to: (i) assess the resulting rate change impacts on customers; (ii) make informed choices on rates and services; (iii) identify any issues that may impede or support electricity generation in the province of Ontario; (iv) allow for prudent budgeting and planning; and assess the relative rate and cost allocation implications of the IR model selected by EGD. Currently, the rate-making process and rate impacts associated with EGD's proposed revenue cap IR model are uncertain and it is challenging for customers to assess each of the above-mentioned factors.

## **RESPONSE**

- a) Please see Enbridge Gas Distribution's October 1, 2007 QRAM application for the information requested in Columns b, c and d. The information requested in Columns e and f will be part of the Company's 2008 rate setting filing (which is expected to be filed with the Board on September 25, 2007).
- b) The information requested in Columns a and b will be part of the Company's 2008 rate setting filing (which is expected to be filed with the Board on September 25, 2007). The rates will continue to be set on an annual basis during the IR plan period. Therefore, the Company cannot provide the information requested in Columns c through f.

## TRANSALTA INTERROGATORY #2

## INTERROGATORY

1. Ref: Enbridge Exhibit B, Tab 6, Page 2

Issue Number: 7.1

Issue: How should the impacts of NGEIR decisions, if any, be reflected in rates during the IR plan?

- (a) Please identify any and all changes to base rates resulting from NGEIR that have been incorporated into the EB-2006-0034 Draft Rate Order.
- (b) Please identify any and all changes to rates resulting from NGEIR that have yet to be incorporated into the EB-2006-0034 Draft Rate Order.
- (c) Please provide, in unit rate (\$/GJ) and by percentage, the current estimated impact of these NGEIR changes estimated in the components provided in the tables provided in (b) above for 2008-2012.
- (d) Please provide: (i) the current estimates of the number of large volume customers migrating to Rates 125, 300, 315 and 316, and the assumptions used to formulate this data used for the purposes of the 2008 Unbundled Rate Customer Migration VA; and (ii) the actual number of customers that will have migrated as of September 1, 2007.
- (e) Please provide any and all: (i) rate impacts; and (ii) change in services or fees that EGD has included in its evidence and/or intends to bring forward during the R plan term following the Board's decision in EB-2006-0322; EB-2006-0338; EB-2006-0340.

## RESPONSE

a) Enbridge Gas Distribution has developed the following unbundled distribution and storage services as part of the NGEIR generic proceeding:

Rate 125: Extra Large Firm Distribution Service

Rate 300: Firm or Interruptible Distribution Service

Rate 315: Gas Storage Service

Rate 316: Gas Storage Service at Dawn

Rates 300 and 315 were implemented on January 1, 2007. Rate 125 was implemented on July 1, 2007. Rate 316 will be implemented on October 1, 2007.

The EB-2006-0034 Final Board Order also reflects the impact from the EB-2005-0551 NGEIR Decision to reflect cost-based storage rates for services acquires from Union Gas.

- b) The EB-2006-0034 Final Board Order reflects impacts from the EB-2005-0551 NGEIR Decision that are pertinent to Enbridge Gas Distribution for the 2007 Test Year.
- c) The Company's rates will continue to be set on an annual basis during the IR plan period. Therefore, the Company cannot provide the information requested in Columns c through f to TransAlta Interrogatory #1 at Exhibit I, Tab 16, Schedule 1.
- d) As of August 31, 2007, eight (8) large volume customers have migrated to Rate 300. At the present time, Enbridge Gas Distribution does not foresee forecasting further migration to unbundled rates for the purpose of the 2008 Unbundled Rates Customer Migration Variance Account.
- e) Please see Enbridge Gas Distribution response to Coral Energy #1, part a) (I-15-1, Part a).

## INTERROGATORY

4. Ref: Enbridge Exhibit B, Schedule 1, Tab 1, Page 17, Exhibit B, Schedule 1, Tab 4, Pages 5-6, Pages 11-12,, Exhibit B, Schedule 2, Tab 4, Page 1

Issue Number: 7.1

Issue: How should the impacts of NGEIR decisions, if any, be reflected in rates during the IR plan?

- (a) How will the Y-factor expenses be reviewed, given that they are to be incorporated on an annual basis?
- (b) How will any large increases in Y-factor expenses be incorporated, given that a large increase would have a significant impact if incorporated on an annual basis?
- (c) Please describe exactly how upstream transportation credits will be treated and charged to customers under EGD's IR plan? Does the Company anticipate that this will change upon the implementation of the new CIS system? Does the company anticipate that any costs/benefits related to T-service credit accounting and billing will be included in rates? If so please describe the mechanism and specifically indicate if this will be included in the Y-factor expenses? If not, how is this accounted for in the IR plan?

## **RESPONSE**

- a) and b) The Company is proposing that Y-factor expenses be passed-through at cost of service on an annual basis. The Company is planning to file Y factors and associated cost of service distribution revenue requirement together with other rate setting information annually as outlined in Enbridge Gas Distribution pre-filed evidence at Exhibit B, Tab 6, Schedule 1, pages 1 and 2 and Exhibit C, Tab 4, Schedule 1.
- c) As outlined in the EB-2006-0034 Settlement Proposal at Issue 6.4, the Company will continue to charge and rebate the T-service credit to Ontario T-service customers until such time as the new CIS billing system is in place. The proposed

## **IGUA INTERROGATORY #2**

## **INTERROGATORY**

Ref: EGD Evidence, Ex.B, Tab 1, Schedule 1, pp. 15 to 22

Issue Nos.: 1.2, 5.1, 6.1

Issue: 1.2 What is the method for incentive regulation that the Board should approve for each utility?

- 5.1 What are the Y factors that should be included in the IR plan?
- 6.1 What are the criteria for establishing Z factors that should be included in the IR plan?

The evidence indicates that the IR regime EGD proposes contemplates that a number of components of EGD's base year regulated revenue requirement will continue to be subject to some form of continuing Cost of Service ("COS") regulation for the duration of any IR plan the Board might approve for EGD. In this context, IGUA regards Y factors, including Deferral Accounts, and Z factors as continuing COS features of rate regulation. IGUA wishes to obtain EGD's analysis of the extent to which its regulated revenue requirement will continue to be subject to some form of continuing COS regulation over the duration of any IR plan the Board might approve for EGD. To this end, please provide the following:

- (a) EGD's total base year regulated revenue requirement.
- (b) The portion of the revenue requirement to be provided in response to question (a) which is EGD's total base year delivery-related revenue requirement.
- (c) A segregation of the total regulated revenue requirement to be provided in response to question (a) between the following broad categories:
  - Cost of gas, operations and maintenance expenses,
  - Depreciation,
  - Property taxes,
  - Capital taxes.
  - Return segregated as follows:
  - o Equity return
  - o Cost of debt
  - o Income taxes
- (d) Within each of these broad categories, list and provide the amount of portion of the regulated revenue requirement which, in whole or in part, falls within the categories of Y factors, including Deferral Accounts, and Z factors proposed by EGD.

Witnesses: R. Campbell

K. CulbertT. Ladanyi

Filed: 2007-09-07 EB-2007-0615 Exhibit I Tab 17 Schedule 2 Page 2 of 2

- (e) Using information to be provided in response to the previous questions, estimate the following:
  - (i) the proportion of the total regulated revenue requirement which will not be subject to some form of continuing COS treatment under the IR plan proposed by EGD, and
  - (ii) the proportion of the delivery-related revenue requirement for EGD which will not be subject to some form of continuing COS treatment under the IR plan proposed by EGD.
- (f) Please list all of the Deferral Accounts for which EGD has obtained Board approval and indicate whether EGD is proposing to eliminate any of those Deferral Accounts as part of its proposed IR plan.
- (g) Is EGD proposing to add any Deferral Accounts as part of its proposed IR plan?

### **RESPONSE**

- Parts a e) Please see the evidence at Exhibit C, Tab 4, Schedule 1 for the treatment of items within the IR plan as proposed by the Company.
  - f) & g) The Company's deferral and variance account evidence at Exhibit B, Tab 5, Schedule 1 provides the information requested in parts f) & g).

Witnesses: R. Campbell

K. CulbertT. Ladanyi

### **IGUA INTERROGATORY #6**

### **INTERROGATORY**

Ref: EGD Evidence, Ex.B, Tab 1, Schedule 1

Issue Nos.: 10.1 and 10.2

Issue: 10.1 Should an ESM be included in the IR plan? 10.2 If so, what should be the parameters?

IGUA is interested in obtaining EGD's views on matters pertaining to the appropriateness of including or excluding an Earnings Sharing Mechanism ("ESM") as a feature of its IR plan. In this context, please provide EGD's responses to the following questions:

- (a) In EGD's view, does a regulator have a continuing obligation over the duration of an IR regime to monitor the rates being charged to assess whether they remain within just and reasonable limits and are not producing unreasonable returns for utility shareholders?
- (b) In EGD's view, is an ESM feature of an IR plan equivalent to treating a portion of equity return, in excess of the utility allowed return, as either a Y factor or a Z factor adjustment to rates?
- (c) Is an excessive return "off-ramp" equivalent to a 100% ESM mechanism in favour of the ratepayers?
- (d) Did the comprehensive IR plan EGD was urging stakeholders to adopt a few years ago include an ESM mechanism? If so, please provide details of the ESM proposal EGD was then making.

### RESPONSE

a), b), c) EGD is generally opposed to earning sharing because it dilutes the incentive power of the plan. This position was recognized by the Ontario Energy Board in the Natural Gas Forum Report which states that "the Board views the retention of earnings by a utility within the term of an IR plan to be a strong incentive for the utility to achieve sustainable efficiencies"; and "the Board does not intend for earnings sharing mechanisms to form part of the IR plans" (p. 28). Consequently, earning sharing is not a feature of the Company's IR proposal. Nevertheless, the Company recognizes that so called "over-earning" is a key sensitivity for stakeholders and the Company is prepared to consider an earning sharing

Witnesses: R. Campbell

P. Hoev

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 6 Page 2 of 2

mechanism in the context of negotiations for a complete settlement of the issues of this application.

d) The comprehensive plan discussed with stakeholders in 2001 had a provision for earning sharing on the basis of 50% shareholder/50% ratepayer for earnings above the allowed ROE. The plan was not accepted by Intervenors.

### **IGUA INTERROGATORY #7**

### **INTERROGATORY**

Reference: EGD Evidence, Ex.B, Tab 1, Schedule 1, pp. 11 to 15

Issue Nos.: 1.1

Issue: What are the implications associated with a revenue cap, a price cap and other

alternative multi-year incentive ratemaking frameworks?

In its evidence, EGD rejects the Price Cap recommendations for EGD. PEG's evidence indicates that the Price Cap Index ("PCI") for PEG's non-residential customer classes would be 0.32%, and that the PCI for EGD's Rate 1 customer class would be 1.49%, when a negative average use adjustment factor is included to reduce the X factor. PEG's evidence suggests that the PCI for EGD's Rate 1 customers would be about 0.68% if the negative average use adjustment is treated as a Y factor rather than as an adjustment which reduces the X factor. On an assumption that the Board requires EGD to adopt a Price Cap plan, please provide responses to the following questions:

- (a) What are the statistical confidence levels for the service group PCIs which PEG recommends?
- (b) What other regulators have adopted service group PCIs in the IR plans for utilities they regulate?

### **RESPONSE**

- (a) PEG did not provide any statistical confidence levels. Moreover, absent the data used by PEG as the basis for its recommendation, EGDI is unable to calculate statistical confidence levels.
- (b) The Company is not aware of any other regulators that have adopted service group PCI's in IR plans.

### **IGUA INTERROGATORY #8**

### **INTERROGATORY**

Ref: Enbridge Evidence, Ex.B, Tab 1, Schedule 1, page 4 of 22

Issue No.: 1.1, para. 11

Issue 1.1: What are the implications associated with a revenue cap, a price cap

and other alternative multi-year incentive ratemaking frameworks?

Enbridge lists nine IR principles set out by Board Staff in their January 5, 2007 Discussion Paper. At paragraph 12, Enbridge says that it "generally accepts these principles, with equal weighting" as appropriate criteria to consider in IR Plan design.

- (a) Please explain what Enbridge means by the phrase "generally accepts these principles, with equal weighting"?
- (b) Does Enbridge disagree with any of the nine IR principles?

### <u>RESPONSE</u>

In that the Board Staff Discussion Paper did not suggest a hierarchy, priority or weighting for the principles, the Company assumed equal weighting in making the statement that it "generally accepts" the principles. The Company used the adjective "generally" because it could quibble with the wording of some of the principles; for instance," the pursuit of efficiency should be encouraged" could be better stated as "the pursuit of sustainable efficiency improvement should be encouraged." The Company also suggested another principle; that the plan must encourage the Utility to behave in a manner that is considered appropriate and desirable by existing customers, potential new customers, shareholders, the regulator and the Ontario government.

### **IGUA INTERROGATORY #9**

### **INTERROGATORY**

Ref: Enbridge Evidence, Ex.B, Tab 1, Schedule 1, page 5 of 22

Issue No.: 1.1

Issue: What are the implications associated with a revenue cap, a price cap and other alternative multi-year incentive ratemaking frameworks?

At paragraph 13, Enbridge identifies the following objectives:

- (a) Maintain a safe and reliable system;
- (b) Meet service quality requirements;
- (c) Retain incremental ROE resulting from efficiency and proven initiatives; and
- (d) Respond to the continuing demand for new customer attachment, recently at pace of 45,000 to 50,000 new customers per year. Enbridge goes on to state that all of these objectives cannot be satisfied in a plan that does not adequately compensate the utility for the cost escalation and growth.
- (e) Can a Price Cap Plan adequately compensate Enbridge for the cost escalation and growth pressures it faces? If not, why not?
- (f) If the answer to (a) is yes, please identify the changes that Enbridge believes would be required to the Price Cap Index set out in the PEG Report.

### **RESPONSE**

The Company doubts that a price cap plan would provide adequate revenues since a price cap plan relies on volume growth to compensate for the costs of system growth. As explained in Exhibit B, Tab 1, Schedule 1, page 8, the Board approved gas volume forecast for 2007 is exactly the same as it was in 2002. No volume growth over the period while at the same time, Enbridge incurred the cost of adding over 250,000 new customers to the distribution system.

### **IGUA INTERROGATORY #12**

### **INTERROGATORY**

Ref: Enbridge Evidence, Exhibit "B", Tab 1, Sch 1, p. 12 of 22

Issue No.: 1.2

Issue: What is the method for incentive regulation that the Board should approve for

each utility?

Enbridge states that its depreciation rates are 4.2% and 4.4%, respectively, from mains and services compared to 2.5% and 3.2% for Union, and that this results in significantly higher depreciation expenses. As well, Enbridge states that it has a lower monthly customer charge of \$11.95 per month compared to Union's monthly customer charge of \$16.00.

- (a) Please provide a schedule the contains:
  - (i) all of Enbridge Gas Distribution Inc.'s depreciation rates; and
  - (ii) all of Union's depreciation rates;
- (b) Please provide a schedule which lists:
  - (i) all of Enbridge's monthly customer charges; and
  - (ii) all of Union's monthly customer charges.

### RESPONSE

- (a&b) i) Enbridge Gas Distribution Inc.'s current approved depreciation rates and monthly customer charges are listed in the tables shown on pages 2 and 3 of this response.
  - ii) Provision of Union's information in this regard should be requested of Union Gas.

### Measuring the Canada-U.S. Productivity Gap: Industry Dimensions

Someshwar Rao, Jianmin Tang and Weimin Wang<sup>1</sup> Micro-Economic Policy Analysis Branch, Industry Canada

CANADA IS ONE OF THE RICHEST ECONOMIES in the world. According to the 2004 United Nations Human Development Index, Canada ranks fourth among all countries in terms of quality of life (UNDP, 2004). The rich endowment of natural resources, the large investments in physical and knowledge infrastructure, physical and human capital and innovation, outward orientation of the Canadian economy and the sound micro- and macro-economic policies have all contributed to Canada's prosperity and high quality of life.

In addition to the high levels of standard of living and quality of life, the Canadian economy has performed extremely well since 1995. Between 1995 and 2003, real per capita income in Canada increased at an average annual rate of 2.5 per cent, compared to only 0.6 per cent per year in the first five years of the 1990s, one of the best performances among OECD countries. Strong growth in employment and labour productivity contributed equally to the strong growth in real income. Moreover, Canada's progress on the inflation and fiscal fronts has been exceptional. Similarly, Canada's performance on the trade front has been excellent. Canada has enjoyed considerable surpluses in its trade and current accounts.

However, Canada's labour productivity growth has generally lagged that in the United States since 1995, especially in the last three years. During 2000-2003, output per hour in the Canadian business sector increased at only 1.3 per cent per year, compared to 2.2 per cent in the second half of the 1990s. In three of the four major sectors - primary, construction and manufacturing - labour productivity growth declined between the 1995-2000 and 2000-2003 periods, although the service sector productity growth rate increased somewhat. On the other hand, labour productivity growth in the U.S. business sector actually accelerated significantly, averaging 2.7 per cent per year in 1995-2000 and 3.8 per cent per year in 2000-2003. Consequently, the Canada-U.S. labour productivity gap has widened significantly. In 2003, Canada's labour productivity level for the business sector was about 23 per cent below the U.S. level.

Labour productivity growth in the Canadian manufacturing sector, the battleground of fierce international competition, has been considerably lower than in the United States since 1995. The recent large appreciation of the Canadian dollar vis-à-vis the U.S. currency has eroded sig-

The authors wish to thank Andrew Sharpe and Jeremy Smith for useful comments and suggestions. This is an abridged version of a paper by the same authors, entitled "Productivity Levels between Canadian and U.S. Industries", which was presented at the 2004 annual meeting of the Canadian Economics Association at Ryerson University, Toronto, Ontario, June 4-6 (Rao, Tang and Wang, 2004). The unabridged version is posted with this article at www.csls.ca under Publications and the *International Productivity Monitor*. The views expressed in this paper are of the authors only and should not be attributed to Industry Canada or the Government of Canada. Email: rao.someshwar@ic.gc.ca, tang.jianmin@ic.gc.ca and wang.weimin@ic.gc.ca.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 2 of 12

nificantly the cost position of Canadian exporters in general, and manufacturers in particular.

Canada has actively participated in the globalization process. Exports of goods and services account for over 40 per cent of Canada's GDP and their importance is growing. Similarly, the importance of imports is also growing. Canada is both a major exporter and importer of capital. Its inward and outward foreign direct investment (FDI) orientations are the second highest among G7 countries, after the United Kingdom, and are increasing. Canada has been a net exporter of direct investment since 1996 and the gap between the inward and outward FDI stocks is widening.

Factors of production, including human capital, are footloose. This means that a small open economy like Canada needs to be highly competitive vis-à-vis its trading partners, especially the United States, our largest trading partner and one of the most innovative and dynamic economies in the world. Otherwise, Canada will not be able to retain and attract physical and human capital and innovation activities, creating a vicious cycle of low productivity and real income growth, weak investment in physical and human capital and innovation, and the widening of the Canada-U.S. productivity and real income level gaps.

In this context, a detailed industry analysis of Canada-U.S. productivity levels and their time profile is crucial for four main reasons:

- First, future productivity growth prospects partly depend upon the current gap with the productivity leader, the United States. The higher the level gap, the larger the scope for a faster productivity growth in Canada due to catch-up, and vice versa.
- Second, the cost competitive position of each Canadian industry, other things being equal, depends on the productivity gap.
   Cost competitiveness and the productivity gap are expected to be negatively related.
- Third, Canada's ability to offer competitive rewards to factors of production depends on

the labour and total factor productivity gaps. The higher the gap, the lower will be Canada's capacity to compete effectively with other countries for factors of production, and vice versa.

Finally, Canada-U.S. productivity level differences help shed light on Canada's long-term comparative advantage position. The industries in which Canada's productivity levels are consistently above the U.S. levels, other things being equal, are expected to have a comparative advantage vis-à-vis their U.S counterparts, and vice versa.

The objective of this article is to develop estimates of Canada-U.S. labour productivity and multifactor productivity (MFP) gaps for 31 industries. Using benchmark estimates for Canada-U.S. bilateral expenditure purchasing power parities (PPPs) for 1999, we develop PPPs for gross output, intermediate inputs, value added, and investment by industry. These in turn are used to estimate the benchmark (1999) estimates for the labour productivity, capital intensity and multifactor productivity (MFP) gaps for all the industries. Using the benchmark estimates of the productivity gaps and the productivity growth rates in the two countries, we develop time series for the two productivity gaps for each industry for the period 1997-2001.

According to our estimates, labour productivity in the Canadian business sector was 18 per cent below the U.S. level in 1999 and the gap has widened significantly since 2000. With the exception of construction, Canada's labour productivity levels are considerably lower in three other major sectors: primary, manufacturing and services. However, within the manufacturing sector, Canada enjoys a significant productivity advantage in many resource-based and transportation equipment industries. On the other hand, the productivity gap is quite large in the machinery and computer industry and in the electronics

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 3 of 12

and electrical equipment industry. Nevertheless, in 2001, service industries accounted for over three quarters of the Canada-U.S. business sector labour productivity gap. The industry contributions to the MFP gap are similar to those to the labour productivity gap. The capital intensity gap's contribution to the business sector labour productivity gap increased from 20 per cent in 1997 to 30 per cent in 2001, while it accounted for 50 per cent of the manufacturing sector labour productivity gap in 2001.

We organize the article in the following way. In the first section, we discuss various difficulties in estimating Purchasing Power Parity (PPP) and productivity gaps at the industry level. We also discuss data sources and the PPP estimates in this section. We present labour productivity levels in the second section, together with the capital intensity and the MFP gaps. In addition, we examine the contributions of each industry to the aggregate business sector labour productivity and MFP gaps, as well as the contribution of capital intensity to the labour productivity gap in each major industry. In the last section, we summarize the main findings of our study and examine their implications for policy and future research.

### Conceptual and Measurement Issues

### **General Issues**

Estimates of productivity growth rates and productivity levels by industry are fraught with many conceptual and measurement difficulties. In addition, inter-firm, inter-industry, interregional and inter-temporal comparisons are challenging. More importantly, international comparisons are extremely difficult because of data comparability problems and serious conceptual issues. Therefore, productivity comparisons should be interpreted and used with considerable care.

When we talk about productivity, there are two principal categories: partial productivity and multifactor or total factor productivity (MFP). Measures such as labour and capital productivities are partial measures. They are not only influenced by the efficiency with which all factors are combined in the production process but also by the relative use of all other factors of production. On the other hand, MFP is the weighted sum of the productivities of all inputs.

The most comprehensive measure of productivity is MFP, because it measures the efficiency of all inputs. But labour productivity is often used for two main reasons. First, labour productivity is a direct determinant of per capita GDP, a measure of living standards. Second, it is easy to understand, easy to calculate and easy to update. On the other hand, estimates of MFP entail higher data demands and are sometimes more difficult to calculate for the most recent period. In this article we use both measures.

The next issue is the concept of output. At the economy or the business sector level, the most appropriate measure of output is GDP or value added. On the other hand, at the firm or sector level, one could use either gross output or value added. Although the gross output measure might be conceptually more appealing, its use poses two main difficulties. First, inter-firm, inter-industry and international comparisons are more difficult with gross output based productivity, because of large differences in the intensity of use of intermediate inputs. These could be the result of differences in outsourcing (domestic as well as foreign). Second, industry results are not easy to reconcile with the aggregate data because at the economy level intermediate inputs should be netted out, unless they are imported from foreign sources. In this article, to avoid these difficulties, we use value added as the output measure.

Another issue in computing labour productivity is the concept of labour input. One could use either

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 4 of 12

employment or hours as the labour input. Because of large and growing differences in average hours worked per employed person across firms, industries, countries and time, a labour productivity measure based on persons employed will not necessarily accurately reflect true labour productivity differences and could lead to misleading conclusions. Hence, in this paper we use total hours worked as the labour input. However, we do not adjust for education and experience.

For computing MFP, we also need data on capital input. The concept of capital is more complicated than labour input. The measurement of capital stock and capital services has been the subject of lively and intensive discussion among economists. Depreciation rates and the user cost of capital are the key parameters in computing capital input. Statistics Canada produces different measures of capital stock, with different assumptions about depreciation. In this article, we use the Statistics Canada capital stock measure for Canada that is based on the methodology closest to that used by the U.S. Bureau of Economic Analysis (BEA), because we use BEA capital stock estimates for the United States.

### Issues related to International Comparisons

In this article, we focus our analysis on Canada-U.S. comparisons for two key reasons. First, we have reasonably comparable data on outputs and inputs by industry for the two countries. Second, Canada-U.S. comparisons are crucial because the United States is our largest trading partner and the two countries compete vigorously for physical and human capital and innovation activities. We restrict our Canada-U.S. comparisons to the business sector rather than the total economy because competitiveness and comparative advantage are mainly influenced by business sector productivity performance.<sup>2</sup> Moreover,

measured labour productivity growth in the nonbusiness sector is expected to be close to zero, because growth in real output is conventionally proxied by the growth in labour input in nonbusiness sector industries.

Despite a fair degree of comparability of industries and data on outputs and inputs between the two countries, productivity growth comparisons by industry should be used cautiously because some of the differences in productivity growth in the two countries might be simply a reflection of differences in product composition.

Canada-U.S. productivity level comparisons are much more difficult than growth comparisons for two main reasons. First, obtaining comparable data on outputs and inputs in levels is a tedious task. If they are not based on comparable concepts in the benchmark year, we could reach misleading conclusions about Canada's productivity record. Second, we need to convert the data on output and capital in the two countries into a common currency. But the market exchange rate is not suitable because it fluctuates a great deal over time and does not necessarily reflect the true purchasing power in the two countries. Instead, we need industry-specific purchasing power parity (PPP) exchange rates. But computing industry-specific PPPs is a complex task. Therefore, reliability of the productivity gap estimates critically depends on the accuracy of the PPPs. We will discuss later on in this section the methodology we use to compute PPPs by industry for gross output, intermediate inputs, value added and two types of investment by industry.

### **Data Sources**

To compute labour productivity and MFP levels by industry in the benchmark year of 1999, we need data on value added in current dollars, total hours, capital stock and input incomes for all 31 industries in the two countries. For Can-

6 NUMBER 9, FALL 2004

<sup>2</sup> The business sector in this study excludes the household sector but includes private health and education services for both countries.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 5 of 12

ada, we have obtained nominal GDP data by industry at basic prices from the Statistics Canada GDP by Industry accounts. These are converted to factor cost by "peeling off" net indirect taxes on production. Data on total hours worked are from the Productivity Program of Statistics Canada. The two types of non-residential net capital stock data, based on the geometric (infinite) depreciation scheme, are produced by the Investment and Capital Stock Division of Statistics Canada. Data on labour compensation and capital income (nominal value added at factor cost net of labour compensation) by industry for the two countries are derived from the inputoutput tables. All Canadian data are based on the North American Industry Classification System (NAICS), but have been reclassified into the 31 industries presented in this article.3

Data on U.S. GDP by industry at factor cost and input prices are obtained from the Bureau of Economic Analysis (BEA). Data on total hours worked for the 1997-2000 period are from the Jorgenson productivity data base (see Ho, Rao and Tang, 2004). They are extended to 2001 using the growth rate of full-time equivalent employees from the BEA. Data on non-residential capital stock (two types) are also from the BEA. All the U.S. data are based on the U.S. 1987 Standard Industrial Classification, but have been reclassified into the 31 industries presented in this article.

The data comparability problems between the two countries for nominal GDP by industry, input prices and employment are not very serious. However, there has been a great deal of discussion and disagreement about the comparability of data on average hours worked by each employed person. It is commonly agreed that, on average, American workers work longer

hours in a year compared to Canadian workers. Our data confirm this. In 2001, average annual hours worked in the Canadian business sector were about 7 per cent lower than in the United States. This difference in average hours in the two countries underscores the importance of using total hours as the measure of labour input for Canada-U.S. productivity level comparisons. The use of employment would seriously underestimate Canada's productivity levels relative to their U.S. counterparts.

### **Estimates of Industry PPPs**

The basic data on expenditure-based bilateral PPPs in 1999 for 221 basic expenditure categories, aggregated over 2000 commodities, were developed jointly by Statistics Canada and the U.S. Bureau of Labor Statistics (BLS). However, since the expenditure-based PPPs are available only for commodities used for final consumption, we have no PPPs for commodities that are used primarily as intermediate inputs. To fill this data gap, we use the Canada-U.S. market exchange rate as a proxy for the PPP rate for commodities that are traded internationally, such as grains, copper, steel and precious metals. PPPs for other commodities which are used as intermediate inputs in the manufacturing sector, such as chemicals, rubber and plastic products and non-metallic minerals, are proxied by the unit value ratios (UVRs) obtained from van Ark, Inklaar and Timmer (2000).

The expenditure-based commodity PPPs are at purchasers' prices. They are converted into production-based PPPs at producers' prices by adjusting with margins, calculated using the input-output tables of the two countries. These in turn are used to develop PPPs for gross output, intermediate input, and two types of investment

<sup>3</sup> Output, hours and capital stock data for Canada can be accessed from CANSIM Tables 379-0023, 383-0010 and 031-0002 respectively.

<sup>4</sup> The U.S. hours worked estimates are based on estimates of hours paid from the BEA. For each industry these estimates are scaled to hours worked using information from the Survey of Hours at Work of the U.S. Bureau of Labor Statistics.

Other electronic equipment	1.44	1.33	1.63	1.35	1.41	1.03
Electrical equipment	1.49	1.33	1.79	1.35	1.41	1.03
Motor vehicles	1.38	1.42	1.28	1.42	1.50	1.03
Other transportation equipment	1.37	1.40	1.33	1.42	1.50	1.03
Furniture and related products	1.46	1.34	1.59	1.40	1.51	1.03
Miscellaneous manufacturing	1.33	1.30	1.36	1.31	1.38	1.03
Services Industries	1.17	1.27	1.09	1.17	1.33	1.03
Utilities	1.26	1.29	1.25	1.20	1.40	1.03
Wholesale trade	1.18	1.24	1.15	1.27	1.32	1.03
Retail trade	1.18	1.21	1.16	1.22	1.39	1.03
Transportation	1.18	1.41	1.00	1.26	1.36	1.03
Information and cultural industries	1.17	1.25	1.09	1.21	1.28	1.03
FIRE	1.13	1.19	1.09	1.19	1.34	1.03
Business services	1.20	1.24	1.18	1.26	1.30	1.03
Other services	1.00	1.31	0.73	1.11	1.31	1.04
Business Sector	NA	NA	1.14	1.20	1.37	1.03

for 1999, disaggregated by industry. These PPP estimates are shown in Table 1.

The value added PPPs are derived residually from the gross output and intermediate input PPPs. Within the manufacturing sector, the value added PPPs vary considerably across industries, from a low of 0.97 (almost parity) in printing and publishing to a high of 2.07 in fabricated metals. On the other hand, the variation among most service industries is quite small,

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 7 of 12

with a range between 1.00 and 1.25. However, for the other services industry (which includes repair and maintenance, personal and laundry services and religious, civic and professional organizations), the PPP is only 0.73. In the construction industry also the value added PPP is less than one.

The M&E PPPs are well above parity in all industries and the variation across industries is not large. They range from a low of 1.28 in the information and cultural industry to a high of 1.56 in the primary and fabricated metals industries. For the business sector as a whole, the M&E investment PPP was 1.37 in 1999, very close to the market exchange rate. On the other hand, the business sector PPP for structures is very close to parity (1.03) and is virtually the same across all industries.

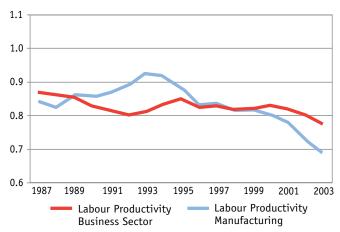

### The Canada-U.S. Productivity Gaps

### Estimates of Labour Productivity Gaps

Using industry data on nominal GDP, total hours and the estimates of value added PPPs, we compute estimates of Canada-U.S. labour productivity gaps for 31 industries in the benchmark year of 1999. These benchmark estimates in conjunction with labour productivity growth rates in individual industries in both countries are used to develop a time series of the productivity gaps for the period 1997-2001. These estimates are given in Table 2. In addition, using aggregate data on labour productivity growth in the business and manufacturing sectors in both countries, we have developed long time series (1987-2003) on the labour productivity level gap for these two sectors. These are displayed in Chart 1.

According to our estimates, the labour productivity (real GDP per hour) level in the Canadian business sector was 22.6 per cent below the U.S. level in 2003, and the gap between the two

### Chart 1 Relative Labour Productivity in Canada, 1987-2003 (United States=1.0)

Notes: Labour productivity is defined as real GDP per hour worked, PPP based. The series are derived by extending the estimates for 1999 from Table 2 using official productivity growth rates from Statistics Canada and the U.S. Bureau of Labor Statistics.

countries had widened significantly from 16.9 per cent in 2000 (Chart 1). The widening of the labour productivity gap in the manufacturing sector is much more pronounced. The gap widened from 7.6 per cent in 1993 to 31.1 per cent in 2003. Our gap estimate for the business sector is similar to other available estimates for the total economy by OECD (2003a), Conference Board of Canada (2003) and Lafortune and Lee (2004). However, a recent Statistics Canada draft paper estimates the gap for the business sector to be only between 6 and 15 per cent for 1999, depending on the assumptions about the PPP rate.

Our estimates show a significant productivity gap in the primary, manufacturing and services sectors, but a large productivity advantage in construction (Table 2). Nevertheless, the productivity gap varies a great deal across the 31 industries. In 2001, it varied from a 50 per cent productivity advantage in the primary metals industry to a 54 per cent disadvantage in the electronic and electrical equipment industry. Labour productivity was lower in all Canadian service industries in 2001 than in their U.S. counterparts, except

Furniture and related products	0.67	0.71	0.73	
Miscellaneous manufacturing	0.58	0.58	0.56	
Services Industries	0.79	0.79	0.81	
Utilities	0.79	0.77	0.75	
Wholesale trade	0.73	0.71	0.69	
Retail trade	0.85	0.85	0.82	
Transportation	0.99	0.98	1.04	
Information and cultural industries	0.67	0.65	0.60	
FIRE	0.60	0.58	0.55	
Business services	0.78	0.79	0.86	
Other services	0.83	0.83	0.90	
Business Sector	0.83	0.82	0.82	

Notes: Labour productivity is defined as value added per hour. The totals for the benchmark year 1999 are aggregated from their industries based on the trans-log aggregation formula. The benchmark estimates are then extended backward to 1997 and forward to 2001 using the annual labour productivity growth rates for both Canada and the United States for 1997-2001.

transportation. The gap ranges from a low of 14 per cent in business services to 45 per cent in finance, insurance and real estate.

Within the manufacturing sector, Canada enjoys a significant productivity advantage in resource-based industries such as wood products, paper, chemicals, non-metallic minerals and primary metals. In addition, Canada's labour productivity level is also higher in printing and publishing, motor vehicles and other transportation equipment. In most of these industries, the productivity advantage strengthened between 1997 and 2001. On the other hand, the productivity gap is large in labour intensive industries such as textiles and clothing as well as in fabricated metals, the machinery and computers industry, and the electronic and electrical equipment industry. The gap widened considerably in these latter two industries between 1997 and 2001.

### Industry Contributions to the Business Sector Labour Productivity Gap

The service sector's contribution to the Canada-U.S. business sector labour productivity gap increased from 81.6 per cent in 1997 to 85.3 per cent in 2001 (Table 3). The finance, insurance and real estate industry is one of the major contributors to the productivity gap. Its share in the business sector productivity gap increased by 6.6 percentage points between 1997 and 2001, reaching 26.9 per cent in 2001. The contribution of the manufacturing sector to the business sector productivity gap increased from 16.4 per cent to 22.2 per cent during this period. The machinery and computers industry, the electronics and electrical equipment industry and the fabricated metals industry accounted for virtually all of the manufacturing productivity gap in 2001. These industries were also responsible for most of the widening of the sector's productivity gap between 1997 and 2001.

### Capital Contribution to the Labour Productivity Gap

What has been the role of the capital intensity gap in the Canada-U.S. labour productivity gap

Capital Intensity Contribution to the Canada-U.S. Labour
Productivity Gap

(per cent)

and the widening of the gap since 1997? Another interesting question is whether the industrial pattern of the Canada-U.S. labour productivity gap can be explained by the industrial pattern of the capital intensity gap. These two questions are answered by looking at the pattern of capital intensity and their trends over time. According to our estimates, the contribution of the capital intensity gap to the business sector labour productivity gap increased from 20.5 per cent in 1997 to 30.3 per cent in 2001 (Chart 2). In the manufacturing sector, the capital intensity gap explained 52.6 per cent of the productivity gap in 2001, compared to 48.0 per cent in 1997. Across the 29 industries, there is a significant positive correlation between the labour productivity and capital intensity gaps. In other words, the industries in which Canada has a productivity advantage are also generally the industries in which we have a capital intensity advantage, and vice versa (Table 4). The simple correlation coefficient between the two series is 0.74 in 2001, compared to 0.61 in 1997.

### Estimates of the MFP gaps

Using the estimates of labour productivity and capital intensity gaps, we calculate the MFP gaps

for 1997, 1999, and 2001. These are presented in Table 5. The trends and industrial pattern of the MFP gaps are generally similar to the labour productivity gaps. The MFP gaps are significantly smaller than the labour productivity gaps in the manufacturing and service sectors. For instance, at the business sector level, the MFP gap in 2001 was only 13 per cent, compared to 18 per cent for the labour productivity gap. This is of course generally explained by the capital intensity gap for these sectors. The MFP gap was only half of the labour productivity gap in the manufacturing sector in 2001. Like labour productivity, Canada's MFP levels are considerably above the U.S. levels in construction, resource-based manufacturing industries and other transportation equipment. On the other hand, Canada's MFP levels are significantly below the U.S. levels in the machinery and computers industry, the electronics and electrical equipment industry, the fabricated metal industry, utilities, and finance, insurance and real estate.

In addition, like labour productivity, service industries contributed over three quarters of the business sector MFP gap, but their contribution has declined since 1997 (Table 6). On the other hand, the contribution of the manufacturing sector increased from 13.8 per cent in 1997 to 19.8 per cent in 2001. Once again, machinery and computers, electronics and electrical equipment, and fabricated metals accounted for most of the manufacturing MFP gap.

The industrial pattern of labour productivity, capital intensity and MFP gaps are very similar, suggesting that capital intensity improves labour productivity directly, as well as indirectly via MFP.

### **Conclusions**

The objective of this article has been to estimate the Canada-U.S. labour productivity and MFP gaps by industry. This has been a major and difficult task and the results need to be

Chemicals	4.7	3.5	4.6	
Plastic and rubber products	2.5	3.7	4.8	
Non-metallic mineral products	-1.1	-2.9	-3.8	
Primary metal	-5.6	-7.4	-9.7	
Fabricated metal	12.4	16.1	21.1	
Machinery and computers	-1.9	6.6	8.7	
Electronic and electrical equip.	-1.4	1.3	1.7	
Motor vehicles	0.9	-4.6	-6.1	
Other transportation equipment	-5.9	-8.0	-10.5	
Furniture and related products	1.7	1.9	2.5	
Services Industries	78.9	82.0	77.5	
Utilities	11.4	10.5	9.1	
Wholesale trade	-5.1	-3.0	-2.0	
Retail trade	4.5	4.8	7.7	
Transportation	0.4	1.3	-0.9	
Information and cultural industries	6.2	5.7	7.3	
FIRE	14.8	18.0	22.3	
Business services	1.8	2.3	-1.3	
Business Sector	100.0	100.0	100.0	

Notes: Contributions at the industry level for the manufacturing and for the service sector do not sum to the total sector contributions due to the omission of the miscellaneous manufacturing industry and the other services industry respectively.

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 15 Attachment Page 12 of 12

the businsss sector. In 2003, Canadian labour productivity in the business sector was 22.6 per cent below the U.S. level, compared to 31.1 per cent in the manufacturing sector.

Canada's labour productivity levels are significantly below the U.S. levels in three of the four major sectors: primary, manufacturing and services. On the other hand, Canada enjoys a significant productivity advantage in construction. Within the manufacturing sector, Canadian productivity levels are significantly above the U.S. levels in resource-based industries. On the other hand, the Canada-U.S. productivity gap is very large in the machinery and computers industry and the electronics and electrical equipment industry. The widening of the manufacturing labour productivity gap since 1997 is mostly due to the large deterioration in the relative position of these two industries.

In 2001, more than 85 per cent of the business sector labour productivity gap was due to the service sector productivity gap. This means that to close the real income gap with the United States we need to focus our efforts in closing the service sector labour productivity gap. The capital intensity gap, particularly the M&E gap, accounts for over 30 per cent of the labour productivity gap in the service sector and over half of the manufacturing productivity gap. Our results also suggest that the capital intensity and MFP gaps are positively correlated.

In other words, closing the capital intensity gap is very important for closing the productivity and real income gaps. Canada needs to be a highly competitive location for business investment. Competitive and flexible regulatory frameworks and a highly competitive corporate income tax structure would be very helpful in this regard.

In addition, our recent research suggests that inward FDI not only increases capital accumulation, but also exerts positive productivity spill-overs. Therefore, retaining and attracting FDI would be highly beneficial to the Canadian

economy. In this context, OECD (2003b) suggests that by bringing down its foreign investment regulations to U.K. levels which are lowest among the OECD countries, and reducing the product market regulations to the OECD average, Canada could double its FDI stock.

Future research should focus on an in-depth analysis of the reasons for the capital intensity and MFP gaps by industry. Such an analysis would provide more insights into the sources of the Canada-U.S. real income gap. Differences in product and labour market regulations, FDI restrictions, tax structure, skills, R&D support, competition, demographic structures and product composition could be considered explanatory variables.

# Comparing AltReg Options

Lawrence Kaufmann, *Partner* Pacific Economics Group Alternative Regulation for Electric and Gas Utilities Boston, MA June 25, 2006

### Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 2 of 41

### Introduction

Effective utility regulation should create

- Strong performance incentives for companies
- Benefits (e.g. lower prices) for customers

\_ower unit costs » ultimate source of customer benefits Strong performance incentives » lower unit costs

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 3 of 41

### ntroduction (cont...)

BUT there is usually a trade off between

- Creating incentives to perform efficiently
- Transferring efficiency gains to customers as lower prices

gains to customers reduces incentives to undertake actions that >> companies pursue efficiency to profit, transferring efficiency improve efficiency

Exhibit I Tab 17 Schedule 16 Attachment Page 4 of 41

### EB-2007-0615

## Introduction (cont..)

Policymakers try to balance goals of incentives and customer benefit

Can be done many different ways

- Change term of incentive regulation (e.g. CPI-X) plan
- Add earnings sharing mechanism (ESM) to plan
- Transfer all efficiency gains customers end of plan
- Transfer some efficiency gains customers end of plan

Exhibit I Tab 17 Schedule 16 Attachment

gains and potential customer benefits

## Introduction (cont..)

These options involve many implementation decisions

How long a plan term?

What fraction of "over earnings" should companies keep during plan?

Should the ESM have different sharing fractions for different levels of company earnings?

Should the ESM have "deadbands"?

What fraction of efficiency gains should be transferred to customer at end of plan?

All these options should consider the impact of these decisions on company incentives since that is the ultimate source of efficiency

Exhibit I Tab 17 Schedule 16 Attachment Page 6 of 41

### EB-2007-0615

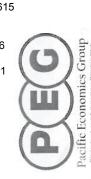

## Introduction (cont..)

Evaluating these regulatory options very complex

Would be good if there was a tool that:

 Quantified incentive – benefit tradeoffs under different regulatory options Evaluated long-term impact or customers and companies of different regulatory regimes

Pacific Economics Group (PEG) has developed an "incentive power" model for these purposes

### Exhibit I Page 7 of 41

Filed: 2007-09-04 EB-2007-0615 Tab 17 Schedule 16 Attachment

## Plan of Presentation

Introduction

Incentive power idea

Current uses Incentive Power Models in utility regulation

PEG's Incentive Power Model

Basics

Evaluation different regulatory regimes

Implications

Conclusions

## I. Incentive Power Idea

Known that different regulatory options have different implications for incentives

Can consider two polar cases:

"pure" cost of service regulation

>> prices tied to company's own costs each year

"pure" benchmark regulation

>> prices de-linked from company's cost each year

"Incentive Power"

Summarizes strength of incentives in regulatory regime

Generally increases as less weight placed on cost of service regulation

EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 8 of 41

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 9 of 41

# Incentive Power Idea (cont...

Early, simple incentive power model

P = (1-b) c + b B P = utility price charged

C = utility's own cost

b = weight placed on external benchmark

>> b also is the "power" of the regulatory regime

### Filed: 2007-0 EB-2007-0618 Exhibit I Tab 17 Schedule 16 Attachment Page 10 of 41

## Incentive Power Idea (cont..)

Actual regulation more complex

Few if any cases of "pure" cost of service regulation (COSR) or benchmark regulation Most regulatory regimes somewhere between extremes

Many different ways to design COSR and incentive regulation

Practical incentive power model would take account of summary measure of "power" of regulatory regime practical realities of regulation while still providing between the polar extremes

### PEG's Incentive Power Mode (cont...

Some Implications

Model confirms theoretical conclusions

Earnings sharing always reduces incentives

compared with COSR unless plan term lengthened Earnings sharing can lead to worse incentives relative to COSR Earnings sharing has more of an impact on permanent than one-off initiatives How rates are updated has much more of an impact on permanent than on-off cost reduction initiatives

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 40 of 41

# . Conclusions/Further PEG Work

PEG's incentive power model very powerful tool

Can examine thousands of regulatory scenarios, input on companies and customers Can identify what projects will be worthwhile to pursue under different types of regulatory regimes Can be tailored to individual company/country circumstances

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 16 Attachment Page 41 of 41

## . Conclusions/Further PEG Work (cont...)

Model can also calculate impact of regulation on

- Customer benefits

### Abstract

This paper studies the cost structure of gas distribution utilities in Switzerland. Three stochastic frontier models are applied to a panel of 26 companies operating from 1996 to 2000. Efficiency is assumed to be constant over time. The analysis highlights the importance of output characteristics such as customer density and network size. The results suggest that the utilities could slightly reduce their operating costs by improving efficiency. There is no evidence of significant unexploited scale economies. However, our analysis indicates that the estimates of scale economies could be sensitive to the assumptions regarding the variation of output with output characteristics.

### 1. Introduction

In the last decade, many countries started to liberalize their energy markets. Since 2000, the European Union has been gradually opening its gas networks to third party access and the consumers are allowed to choose their optimal contracts. Switzerland is expected to follow its neighboring countries and open its gas market to competition. The general idea is to introduce competition in the wholesale and retail markets, and to have a regulated natural monopoly in the transmission and distribution sectors. Therefore, the network access prices need to be regulated.

Generally, the regulation can follow a traditional approach such as rate-of-return regulation or an incentive-based mechanism like price-cap or vardstick regulation. The application of these three types of regulation approaches calls for a better understanding of the cost structure and the efficiency of the distribution companies. Especially in the case of incentive-based approaches, the regulator could use this information to induce efficient performance. For instance, predicted costs can be used in setting the vardstick competition targets or the efficiency scores can be used as the X-factor in price cap formulas to reward/punish companies according to their performance.<sup>2</sup> Moreover, information about the potential scale economies can help the regulators to evaluate the possibilities of cost saving by encouraging mergers and joint ventures among small companies. Inefficiency in production may come from two different sources: deficiency in applying the technology (technical inefficiency) and suboptimal allocation of resources (allocative inefficiency). Productive inefficiency subsumes these two concepts and can be measured by input or output oriented measures.<sup>3</sup> One of the commonly used measures of productive inefficiency is the deviation from minimum costs to produce a given level of output with given inputs prices. This measure, although usually referred to as cost inefficiency, does not include the inefficiencies due to suboptimal scale of production.

Generally, there are two main approaches for estimating cost inefficiency: the nonparametric approach originated from operations research, and the econometric approach. The parametric methods use econometric theory to estimate a cost function with a specified form, where the inefficiency is modeled as additional stochastic term. The non-parametric methods like Data Envelopment Analysis (DEA) calculate an efficient deterministic frontier by linear programming and do not require a pre-specified functional form. Murillo-Zamorano (2004) provides an account of advantages and shortcomings of each one of these methods. In this paper we focus on parametric methods. The main advantage of these methods over nonparametric approaches is the separation of the inefficiency effect from the statistical noise due to data errors and omitted variables.

It should be noted that the results in term of inefficiency obtained using different approaches can be quite different. Thus, it is important to consider certain consistency conditions. Bauer et al. (1998) and Rossi and Ruzzier (2000) propose a series of criteria to evaluate if the inefficiency estimates obtained from different models are "mutually consistent", that is, lead to comparable inefficiency scores and ranks. Farsi and Filippini (2004) recommend using the results of a benchmarking analysis as a complementary instrument in incentive regulation and not in a mechanical way.

The main goal of this paper is to study the sensitivity of inefficiency estimates using panel data models. We apply different parametric models to a five-year panel of 26 Swiss gas distributors. The inefficiency scores estimated from four different models are compared and the consistency of the estimates across different models is discussed. The economies of scale and density are also estimated. A slightly modified definition of scale economies is used to study the sensitivity of the results to the assumption of equi-proportional changes in output characteristics.

The rest of the paper is structured as follows: Section 2 provides a brief review of the empirical literature in gas distribution sector. Section 3 discusses the different cost frontier models used in

Table 1 An overview of previous studies

Author(s)	Database	Functional Form	Measures of output and characteristics
Sing (1987)	Cross-section of 108 privately owned US gas and electricity distribution utilities, 1981	Hybrid translog cost function with Box–Cox transformation on outputs	Volume of gas delivered/ customers per service area
Hollas and Stansell (1988)	Cross-section of 64 privately owned US natural gas distribution utilities, 1981	Translog profit function with quantity and price shifters	Volume of gas delivered
Kim and Lee (1996)	Panel of 7 Korean gas distributors, 1987–1992	Translog cost function/OLS	Volume of gas delivered/ customer density, average customer size, supply rate
Bernard et al. (1998)	Cross-section of 131 Canadian gas extension projects	Box-Cox cost function	Max. daily demand/pipe length
Granderson and Linvill (1999) and Granderson (2000)	Panel of 20 US natural gas transmission companies, 1977–1987	Translog cost function/ random effects model	Volume of gas delivered
Fabbri et al. (2000)	Panel of 31 Italian distribution companies, 1991–1992	Translog cost function/SURE	Volume of gas delivered/inverse of customer density, average altitude, population density
Rossi (2001)	Panel of 8 Argentinean gas distribution companies, 1993–1997	Cobb-Douglas production function/COLS and Battese and Coelli (1992a,b) model	Volume of gas delivered/service area, share of residential to total sales, maximum demand

the paper. The data are described in Section 4. Section 5 presents the estimation results and discusses their implications regarding inefficiencies. Section 6 discusses the results on economies of scale and density. At the end, the main conclusions are summarized.

### 2. Review of the literature

The literature on econometric estimation of cost or production functions in gas distribution companies is scarce. Table 1 lists a selection of these papers. Hollas and Stansell (1988)<sup>5</sup> are probably the first authors who analyzed this industry by modeling technical and allocative inefficiency. Their model is a behavioral translog profit function that includes output and price "shifters" for four types of companies. Their method allows identifying the relative efficiency of different types with respect to each other, but it does not provide any firm-specific inefficiency estimate. In their specification, they include the price of fuel, labor price, customer density and the fixed capital input measured in daily throughput capacity of the distribution system.

Kim and Lee (1996) highlight the importance of accounting for output characteristics in estimating a translog cost function for gas distributors. In addition to the labor price and the unit price of pipeline, these authors include the customer density, the average "customer size" measured as average consumption and the "supply rate" measured as the number of total customers relative to the number of total potential customers. Bernard et al. (1998) consider the load factor and the network length as major cost drivers that should be included as output characteristics.

<sup>&</sup>lt;sup>5</sup> See Hollas and Stansell (1994) for a similar application to estimate the economic efficiency of public and private gas distribution utilities.

Granderson and Linvill (1999) and Granderson (2000) used an eleven-year panel of 20 U.S. interstate natural gas transmission companies to produce a benchmark for regulation. As inputs, they specify labor, fuel, the weight of the transmission pipelines, and the capacity of compressor station and estimate a translog cost frontier by a random effects GLS model (Schmidt and Sickles, 1984). They also used DEA to get non-parametric estimates of inefficiency and compare the results. Although the results show that when using the nonparametric approach, the inefficiency estimates are lower, the inefficiency ranking stays more or less the same.<sup>6</sup>

Fabbri et al. (2000) estimated a total distribution translog cost function for 31 Italian companies observed during two years. They use the yearly average cost per employee as labor price, the book-value of equipment divided by the length of the distribution network as capital price and the price of material and services is calculated as the residual expenses divided by network length. Output is measured as the volume of gas delivered and the number of customers. Their specification also includes the ratio of network length to the number of customers, share of urban population, the average altitude of the service area, and dummy variables for ownership differences and time effects. Their results suggest a more cost efficient production in private firms. These authors also found that the economies of scale are not significant at the output levels in the data. On the other hand, economies of density appear to be considerable. These results are in line with most of the findings reported in other studies.

Rossi (2001) estimated a stochastic frontier production function using the approach suggested by Battese and Coelli (1992a,b). Rossi used the network length as a proxy for capital input, and the number of employees as the labor input. In addition, the concession area, the ratio of residential sales to total sales and the maximum demand are considered as the environmental variables. The number of customers is used as a single output. In one of his specifications the results suggest significant diseconomies of scale, but another model's results do not reject the hypothesis of optimal scale.

#### 3. Methodology

A frontier cost function defines minimum costs given output level, input prices and the existing production technology. Failure to attain the cost frontier implies the existence of technical and/or allocative inefficiency. This section provides a description of the cost frontier models and the specification used in this paper. The adopted methodology is based on a comparison of different models with respect to the estimated cost function parameters and estimated inefficiency scores. The main goal is to study the limitations of different models in benchmarking and the sensitivity of inefficiency scores to econometric modeling.

#### 3.1. Cost frontier models

In this paper, we consider the estimation of a stochastic frontier cost function using different panel data models. The theoretical development of stochastic frontier models in panel data has been subject of a great body of literature. Recent developments such as random parameter frontier models usually require relatively large samples with sufficient variation. Considering the small size of our sample and the limited number of periods these methods do not appear to be

<sup>&</sup>lt;sup>6</sup> This result is generally consistent with those reported by Carrington et al. (2002) who used the DEA approach and a translog input distance function to estimate efficiency of gas distribution companies.

<sup>&</sup>lt;sup>7</sup> See Kumbhakar and Lovell (2000) for a review and Greene (2005) and Tsionas (2002) for some recent developments.

effective. 8 Considering the characteristics of our data set and the purpose of the paper, we decided to use three classical frontier models for panel data and a variant of one of these models.

The first model is the stochastic cost frontier approach proposed by Aigner et al. (1977). This model is a cross-sectional model but could be applied to a panel data set by pooling the data across different years. This model, which we refer to as the "pooled model", can be written as:

$$\ln C_{it} = \ln C(v_{it}, w_{it}) + u_{it} + v_{it} \quad u_{it} \ge 0, \qquad i = 1, 2, \dots, N \quad \text{and} \quad t = 1, 2, \dots, T.$$
 (1)

In this specification the error term is composed of two independent parts: The first part  $u_{it}$ , is a one-sided non-negative disturbance reflecting the effect of inefficiency, and the second component  $v_{it}$ , is a symmetric disturbance capturing the effect of noise. The statistical noise is assumed to be normally distributed, while the inefficiency term  $u_{it}$  is assumed to follow a half-normal distribution. This model can be estimated using Maximum Likelihood Estimation (MLE) method. Individual inefficiencies can be estimated by the conditional expectation of the inefficiency term,  $E(u_{it}|u_{it}+v_{it})$  proposed by Jondrow et al. (1982).

In the pooled model, a given firm's inefficiency is supposed to vary with time, but could take a value completely independent of its level in the previous years. An extension of this model applied to panel data has been proposed by Pitt and Lee (1981). This model can be written as follows:

$$\ln C_{it} = \ln C(y_{it}, w_{it}) + u_i + v_{it} \quad u_i \ge 0, \qquad i = 1, 2, ..., N \quad \text{and} \quad t = 1, 2, ..., T.$$
 (2)

In this specification it is assumed that the inefficiency term  $u_i$ , follows a half-normal distribution across firms but stays constant over time within a given firm. Although this assumption might appear unrealistic given the fairly long period covered in the sample, our preliminary analyses indicate that the temporal variations of inefficiency are not significant in our data. Similarly, this model is estimated using MLE and the individual inefficiencies are estimated by the conditional expectation of the inefficiency term, given by  $E(u_i|\varepsilon_{i1},...,\varepsilon_{iT})$ , where  $\varepsilon_{it}=u_i+v_{it}$  with t=1,2,...,T.

The assumptions about the distribution of the random terms  $u_i$  and  $v_{it}$  can be relaxed by rewriting Eq. (2) as:

$$\ln C_{it} = \ln C(y_{it}, w_{it}) + \alpha + u_i^* + v_{it} \text{ with } u_i = u_i^* - \min\{u_i^*\} \text{ and } \alpha = \min\{u_i^*\},$$
 (3)

where  $u_i^*$  is the firm-specific random effect. The resulting model, proposed by Schmidt and Sickles (1984), can be estimated using the feasible Generalized Least Squares method.

The remaining restrictive assumption is that the random effects are uncorrelated with the observed characteristics included in the cost function. Schmidt and Sickles (1984) propose a solution to relax this assumption by using the fixed effects specification. The main shortcoming of this model is that the inefficiency measures may be confounded with time-invariant factors, which

<sup>&</sup>lt;sup>8</sup> In a preliminary analysis we applied some of these models especially the true random effects proposed by Greene (2005, 2004). The results generally indicate that due to the insufficient variation in the data, some of the random terms degenerate to zero. This suggests that these types of specifications are too rich for our data. For an application of these models in other network industries, see Farsi et al. (2006, 2005a).

<sup>&</sup>lt;sup>9</sup> We first explored the time variation by including a linear trend and year dummies in explanatory variables. None of these time variables showed any significant effect. We also applied an extension of the model of Pitt and Lee (1981) proposed by Battese and Coelli (1992a,b) in which the inefficiency is assumed to follow a time varying exponential decay function. The results indicate that the coefficient of time is statistically insignificant. Moreover, the estimated efficiencies are very close to those obtained from the Pitt and Lee model.

<sup>&</sup>lt;sup>10</sup> Jondrow et al. (1982) provide the expression for conditional mean in cross-sectional data. The extension for panel data is given in Kumbhakar and Lovell (2000) and Greene (2002).

could not be included in the model.<sup>11</sup> To avoid this problem and at the same time controlling for the potential correlation of firm-specific effects with explanatory variables, we applied Mundlak (1978)'s formulation to the GLS model.<sup>12</sup> The correlation of firm-specific unobserved effects with explanatory variables are captured in an auxiliary equation given by:

$$\alpha_i = \gamma \overline{\mathbf{X}}_i + \delta_i$$
, where  $\overline{\mathbf{X}}_i = \frac{1}{T_i} \sum_{t=1}^{T_i} \mathbf{X}_{it}$  and  $\delta_i \sim \mathrm{iid}(0, \sigma_\delta^2)$ . (4)

 $X_{it}$  is the vector of all explanatory variables and  $\gamma$  is the corresponding vector of coefficients. This formulation divides the firm-specific term into two components: The first part can be explained by the exogenous variables and is interpreted as heterogeneity, whereas the remaining component  $\delta_i$  is orthogonal to the explanatory variables and is assumed to reflect the company's inefficiency. Eq. (4) is incorporated in the main regression equation:

$$\ln C_{it} = \ln C(y_{it}, w_{it}) + \gamma \overline{\mathbf{X}}_i + \delta_i + v_{it} \quad \text{with} \quad u_i = \delta_i - \min\{\delta_i\}. \tag{5}$$

This model is estimated by the GLS method. Mundlak (1978) showed that this formulation of the GLS model results in a coefficient vector of  $\ln C(y_{it}, w_{it})$  that is equivalent to the within estimator (fixed effects model) and thus would be unbiased even in presence of firm effects that are correlated with explanatory variables. It should be noted that the fixed effects model (FE) can also be used to estimate the inefficiencies (as proposed by Schmidt and Sickles, 1984). However, we do not use the FE model here, because the estimated coefficients in this model do not bring any additional value to our study as they are exactly equal to those obtained from the GLS model with Mundlak's adjustment. Moreover, the inefficiency estimates from the FE model are overestimated because they include some of the factors (such as area size and customer density) that are almost time-invariant. This issue has been highlighted in an example reported by Farsi and Filippini (2004).

#### 3.2. Specification of the cost function

Gas distribution companies operate in networks with different shapes and environmental characteristics, which directly affect costs. The output is measured as total volume of natural gas delivered. Input factors consist mainly of the gas purchased from a transmission company, labor and capital. Therefore, there are in principle two alternatives for measuring inefficiency: an integrated total cost approach and a network operating cost approach, where expenditures for gas purchases are excluded. The network costs approach has a practical advantage in that the estimated average costs can be directly used in a price-cap formula. However, this approach neglects the potential inefficiencies in the choice of the gas delivery contract. Therefore, in this paper we adopt the total cost approach. The cost function is specified as:

$$TC = f(Y, P_C, P_I, P_F, LF, TB, CUD, ASIZE),$$
 (6)

where TC represents total costs; Y is the energy value of the delivered gas measured in MWh; and  $P_C$ ,  $P_L$  and  $P_E$  are respectively the prices of capital, labor and purchase price of natural gas. In addition to these variables, we also include the load factor LF, the number of terminal blocks TB, the customer density CUD and the area size ASIZE as output characteristics.

<sup>&</sup>lt;sup>11</sup> See Farsi and Filippini (2004) for a discussion of advantages and drawbacks of fixed and random effects models.

<sup>&</sup>lt;sup>12</sup> See also Farsi et al. (2005b) for a similar specification.

<sup>&</sup>lt;sup>13</sup> For a proof of this statement, see also Hsiao (2003).

The load factor is defined as the ratio of annual average flow of gas to the annual peak flow per hour. It is a measure of how constantly the network capacity is used throughout the year. A higher value of load factor implies a lower variation in consumption. The load factor is a demand characteristic and cannot be directly influenced by the company. A network with a low load factor needs more capacity. We therefore expect the coefficient of the load factor to be negative, implying lower costs for companies with more evenly distributed network use.

The number of terminal blocks (TB) is another output characteristic included in the model. Terminal blocks are usually located at the entrance of the buildings and serve several end-users. It is also possible that two or more buildings share a terminal block when they are internally connected. Typically, a terminal block is owned and maintained by the gas distribution company, whereas the pipeline following the block belongs to the customer. The number of blocks is expected to have a positive effect on costs through higher hookup, maintenance and billing costs. Often, the customer density, measured as number of clients per kilometer of network length (CUD), is also considered as an important indicator of costs. <sup>14</sup> The average maintenance cost per customer is lower in networks with higher density, suggesting a negative sign for CUD. The area size (ASIZE) of each utility is included to measure the company's size. <sup>15</sup> Larger service areas generally require larger and more spread networks, thus more operating and maintenance costs.

The regularity conditions require that the cost function in Eq. (6) be nondecreasing in input prices and output, and linearly homogeneous and concave in input prices. <sup>16</sup> In the empirical literature, two main functional forms have been used: the translog and the Cobb–Douglas form. In general, the translog form provides a more flexible framework especially regarding the scale economies, which can vary with the output. However in this paper, given the small size of the sample and the large number of parameters<sup>17</sup> in the translog model, we use the Cobb–Douglas form.

The Cobb-Douglas specification of the cost function in Eq. (6) can be written as:

$$\ln\left(\frac{\text{TC}}{P_L}\right) = \alpha_0 + \alpha_Y \ln Y + \alpha_C \ln\left(\frac{P_C}{P_L}\right) + \alpha_E \ln\left(\frac{P_E}{P_L}\right) + \alpha_{LF} \text{LF} + \alpha_{TB} \ln TB + \alpha_{CUD} \ln CUD + \alpha_{ASIZE} \ln ASIZE$$
(7)

The linear homogeneity condition is imposed by normalizing costs and prices to the labor price. All variables except the load factor are in logarithms. The load factor is a positive value lower than one, thus is not transformed into logarithm.<sup>18</sup>

#### 4. Data

Based on the year 2000 statistics, there are about 128 gas distribution companies in Switzerland. Generally, the distribution companies own the distribution network in which they operate and there is no overlap between the service areas of individual companies. The

<sup>&</sup>lt;sup>14</sup> Sing (1987) uses customers per square mile of service area as density.

<sup>&</sup>lt;sup>15</sup> An alternative measure would be the network length. Given that the latter variable is highly correlated with the area size (correlation coefficient of 0.94), we decided to use the actual length of the network in calculating the capital price and customer density and considered the area size as a measure of the utility's size.

<sup>&</sup>lt;sup>16</sup> See Cornes (1992) for a discussion of the properties of cost functions.

<sup>&</sup>lt;sup>17</sup> In our specification the number of coefficients in translog model would be 36, which results in a relatively small number of degrees of freedom in a sample of 26 companies with 129 observations.

<sup>&</sup>lt;sup>18</sup> We also estimated the model with logarithm of LF. The estimated inefficiencies (not reported here) do not vary much and show a very high correlation with those estimated from the adopted models (generally higher than 0.99).

Table 2
Descriptive statistics (129 observations)

Variables	Mean	Standard deviation	Minimum	Maximum
Total annual costs (TC) in thousand CHF	21411	24477	2592	135382
Annual output (Y) in MWh	548515	729301	58000	4174000
Average annual labor price (P <sub>L</sub> ) CHF per employee	96161	15963	61830	139460
Average annual capital price (P <sub>C</sub> ) CHF per meter network length	28.56	11.43	12.53	75.78

All monetary values are in year 2000 Swiss Francs (CHF), adjusted by the consumer price index.

transmission network is owned and operated by Swiss Gas, a company mainly held by four major public regional gas distributors. Swiss Gas is in charge of transmitting about three fourths of the total national gas consumption. The remaining part is delivered by the transmission pipelines owned by the neighboring countries. Distributors purchase the gas from transmission companies and deliver it through their own distribution networks to the end-use consumers.

The data used in this paper are based on a mail survey from 26 distribution companies accounting for about 57% of the total gas consumption in Switzerland. These companies participated in the survey in a voluntary basis. None of the four regional companies are included. All the participants except one provided the data for five years from 1996 to 2000. The 1996 data is not available for that single company. Thus, the sample consists of 129 observations. The collected data include financial and technical information.

The companies in the sample represent about a fifth of the Swiss gas distributors but own about 40% of the total length of the gas distribution network in Switzerland. This implies that small distributors are under-represented in the sample. Moreover, the average volume of distributed gas per network length in these companies is higher than the national average value. With regard to the service area, our sample covers 42% of all Swiss communities served with gas. Table 2 provides a descriptive summary of the main variables used in the analysis. Total costs TC are the total annual operating costs plus the gas purchases from the transmission sector. Tax expenditures and non-operating costs are excluded. Output *Y* is measured by the total amount of gas delivered to end-consumers and to downstream distributors. <sup>19</sup>

Labor price  $(P_L)$  is defined as the ratio of total annual labor costs, including social security costs, to the number of full time equivalent employees. The price of energy  $(P_E)$  is the average unit price of the purchased gas. The capital price  $(P_C)$  is calculated as sum of expenditures other than labor expenses and gas purchases, divided by the network length. These expenditures include interest payments and depreciation as well as material costs and other services included in operating costs. Capital stock includes the distribution network as well as other equipment such as

<sup>&</sup>lt;sup>19</sup> About one fourth of the companies have gas resale to other distributors. In an alternative specification (not reported here) we controlled for these companies with a dummy variable. Since this dummy is not significantly different from zero we decided to exclude it from the final specification.

monitoring and control systems and the final connections and metering equipment. In fact, lacking any other reliable measure of total capital stock, we assumed that the capital stock is more or less proportional to the network length. As the network is the major part of the capital stock of a gas distributor, network length has been used as a physical measure of capital in the calculation of capital prices. All costs and prices are adjusted for inflation using the Switzerland's consumer price index and are measured in year 2000 Swiss Francs.

#### 5. Estimation results

Estimation results for the four models are given in Table 3. Results show that the output and input price coefficients are positive and highly significant across all models.

Furthermore, the coefficients do not significantly differ from one model to another, suggesting the results for the parameters do not depend on distributional assumptions of the error and inefficiency term. All output characteristics show the expected signs, although the coefficient of the load factor is only significantly different from zero in the GLS model.<sup>20</sup>

The results indicate that all the group mean coefficients in the GLS-Mundlak model are insignificant at 5%. This finding is supported by the Hausman test, which does not reject the hypothesis of similar coefficients between the GLS and fixed-effects models (*P*-value of 0.39). This in turn suggests that the firm effects are not correlated with the explanatory variables. Compared to other models, the model with Mundlak adjustment shows generally higher standard errors. In particular, the coefficient of the service area is not significantly different from zero (at 5% significance level). This result can be explained by the fewer degrees of freedom in this

 $s_v$  and  $s_u$  in the GLS models are respectively the standard deviation of residuals associated with  $v_{ii}$  and  $u_i$ . In Pitt and Lee's model,  $\sigma_v$  and  $\sigma_u$  are the model parameters and are statistically significant at p=0.05.

<sup>&</sup>lt;sup>a</sup> Means significantly different from zero at least at 99%.

<sup>&</sup>lt;sup>20</sup> Similar results were obtained using the logarithm of the load factor.

Table 4 Inefficiency measures

	Pooled	Pitt and Lee	GLS	GLS & Mundlak
Mean	0.058	0.058	0.075	0.075
Median	0.045	0.048	0.068	0.071
Maximum	0.191	0.194	0.193	0.180
95th Percentile	0.144	0.183	0.182	0.156
Minimum	0.012	0.009	0.000	0.000

model. Another important observation is that the estimated coefficients from the pooled model are more or less similar to those obtained from the three panel data models. This result also suggests that the firm-specific unobserved factors do not create a significant bias in the coefficients.

Since total costs and the relevant explanatory variables are in logarithms, the estimated coefficients can be interpreted as cost elasticities. For instance, the output coefficient suggests that on average, a 1% increase in the amount of gas delivered will increase the costs by about 0.7%. Similarly, a 1% increase in the number of terminal blocks will increase the costs by about 0.2%. The cost elasticities with respect to factor prices are positive and of similar magnitude in all models. The estimated coefficient for capital price ( $\alpha$ PC) represents the share of costs attributed to capital, which is about 25%. This result is very close to the average capital share in the actual data of about 29%. Also, the value of the coefficient of energy price ( $\alpha$ PE) reflects its share in the sample of about 59%.

As expected, the negative sign of the coefficient of the load factor suggests that networks that are more evenly utilized throughout the year, are relatively less costly. The results also indicate that the customer density has a negative effect on total costs (negative  $\alpha CUD$ ). The coefficient of area size ( $\alpha ASIZE$ ) is consistent with the contention that *ceteris paribus* larger areas imply longer distances, thus higher organization and maintenance costs. Moreover, larger networks are more likely to be complex.

Table 4 provides a descriptive summary of the inefficiency estimates. These estimates denoted by u in our models, represent the relative excess cost of a given firm compared to a minimum level that would have been achieved if the firm had operated as efficiently as the "best practice" observed in the sample. The results suggest an average inefficiency of 6 to 7.5% (median values of 5 to 7%), which is quite stable across models. As it can be seen in the table the inefficiency estimates obtained from the pooled model and Pitt and Lee specification are quite similar. The fact that the assumption regarding the temporal variation of inefficiency does not affect the results, suggests that the inefficiencies could be considered as more or less constant over time. Constant efficiency estimates are not surprising, because although one might expect to observe changes in efficiency over the five-year sample period, the studied companies operate in a heavily regulated system that has not changed significantly. The results also show that the extreme inefficiency estimates slightly decrease when the correlation of unobserved firm-specific variables is taken into account (Mundlak formulation).

Table 5
Pairwise Pearson correlation between inefficiency estimates

	Pooled	Pitt and Lee	GLS
Pitt and Lee	0.837	1	
GLS	0.850	0.956	1
GLS and Mundlak	0.857	0.873	0.935

Table 6 Economies of scale and density

Measure Term		Value	Confidence	interval
Economies of density	1/ <b>a</b> Y	1.57	1.28	1.86
Economies of scale	$1/(\alpha Y + \alpha TB + \alpha ASIZE)$	0.94	0.80	1.09

95% confidence intervals are calculated by the delta-method.

The pairwise Pearson correlation matrix of the inefficiency estimates presented in Table 5, shows a generally high correlation. This suggests that the estimates are reasonably robust to specification. The results of Spearman rank correlation (omitted from the paper) are similar to those in Table 5. However, our analysis of efficiency ranks indicates that although the most and least efficient firms remain stable across different models, the companies in the first and last quintiles change from one model to another. These results indicate that the mutual consistency criteria of Bauer et al. (1998) are not fully satisfied. Therefore, the estimated individual inefficiency scores could incur considerable estimation errors that could also affect ranks. The results are consistent with Horrace and Schmidt (1996) who show that even a panel with 6 periods cannot provide reasonable estimates of individual efficiency scores. The results are however more reliable concerning the average inefficiency in the sector or in a group of companies. As shown in Table 4, on average inefficiency is responsible for about 5 to 7% of the operating costs in the Swiss gas distribution utilities.

#### 6. Economies of scale and density

In the cost function framework, returns to scale can be defined in terms of the relative changes in costs due to an increase in output, namely the inverse of output elasticity in a cost function. In network industries however, the output variation is generally together with a change in output characteristics such as network size. In such cases, the concept of density economies is used to describe the effect of changes in output with the network characteristics being fixed (cf. Caves et al., 1984, 1985). As for the scale economies it is generally assumed that, in line with Caves et al., (1981), as the production scale increases, all outputs and output characteristics vary at the same proportion. In this case the economies of scale can be defined as the inverse of the sum of the elasticities with respect to outputs and output characteristics, whereas the economies of density are defined as the inverse of output elasticity. Based on these definitions, when scale or density economies are greater than one, the production operates at increasing returns to scale, suggesting potential savings by increasing output. Conversely, values lower than one indicates diseconomies of scale.

Table 6 lists the values of scale and density economies based on the above definitions estimated from the GLS-Mundlak specification. Since the coefficients of the estimated models do not differ much across specifications, in this section we focus on the GLS-Mundlak model. The confidence intervals have also been listed in the table. As scale and density economies are non-linear functions of the estimated coefficients, we used the delta method<sup>23</sup> to calculate the standard

<sup>&</sup>lt;sup>21</sup> In general, this definition differs from the concept of returns to scale in production, which is defined as the change in output resulting from an equi-proportional increase in inputs. Chambers (1988) makes the distinction by referring to the cost-based measure as "returns to size". However, in the case of homothetic production functions (as assumed in this paper), these measures coincide.

<sup>&</sup>lt;sup>22</sup> See also Farsi et al. (2006) for the mathematical expression and Panzar and Willig (1977) for a formal definition.

<sup>&</sup>lt;sup>23</sup> The delta method is an intuitive method to estimate the standard errors of any function of random variables, such as coefficient estimates in a regression model. See Oehlert (1992) for more details.

Table 7
Economies of scale redefined

Measure	Terms	Value	Confider interval	nce
Economies of scale 1	$1/(\alpha Y + \rho TB \alpha TB + \rho AS \alpha ASIZE)$	0.78	0.64	0.93
Economies of scale 2	$1/(\alpha Y + \rho TB \alpha TB + \rho AS \alpha ASIZE + \rho CUD \alpha CUD)$	0.83	0.66	0.99

 $\rho$ TB,  $\rho$ ASIZE and  $\rho$ CUD are respectively the ratios of relative change in TB, ASIZE and CUD to the relative change in output (Y) over the sample period. These values averaged over the ten companies with non-zero change are:  $\rho$ TB=1.66,  $\rho$ ASIZE=1.30 and  $\rho$ CUD=0.26. Confidence intervals are at 95% confidence level and are calculated by the delta-method. The estimation errors of the ratios  $\rho$ TB,  $\rho$ ASIZE and  $\rho$ CUD are neglected in calculating the confidence interval.

errors and the confidence intervals. These results show that the value of economies of density is larger than one, suggesting that distributors could lower their average costs by increasing the output if the service area and the number of customers remain constant. This is reflected by the value of the output coefficient  $\alpha Y$ , which implies that a 1% increase in output would increase costs by about 0.64%.

If in the process of increasing output, both area size and number of customers increase with the same proportion, the economies of scale falls to 0.94, which is not significantly different from one (see Table 6). This result, more or less consistent with the previous literature<sup>24</sup>, suggests that on average extending the network does not help to save operating costs. However, these results are based on the conventional definition of multiproduct economies of scale, which assumes that all outputs and output characteristics increase by the same proportion. This assumption could be unrealistic in practice. For instance a 10% extension of the network might result in a lower increase in output, because the newly connected customers could have a lower density and consumption. Especially, this relationship might also depend on the network and environmental characteristics of the company. In fact a simple analysis of changes over the sample period shows that despite relatively strong inter-correlation, the output characteristics do not vary at the same proportions.

The data indicate that while the company's gas output has shown an average growth of about 9% over the sample period, the number of terminal blocks have grown by 11% on average and the covered area size by about 4%. The ratio of change differs across companies. Focusing on the ten companies with a non-zero change in their network over the sample period, we calculated the ratio of relative change in an output characteristic to the relative change in the amount of delivered gas (output *Y*) for each company. This ratio is on average about 1.7, 1.3 and 0.3 respectively for the number of terminal blocks (TB), area size (AS) and customer density (CUD). These values suggest that for the companies that had any extension over the sample period, 1% increase in output has been on average, associated with 1.7% extension in area size, 1.3% increase in the number of terminal blocks and a small increase of 0.3% in customer density. This implies that a given increase in output may require a larger extension in the network.

The assumption of equal proportions can be relaxed by weighting the elasticities of each output by its corresponding variation ratio with respect to output. Table 7 gives two variants of scale economies considering non-uniform proportions. The variation ratios ( $\rho$ TB,  $\rho$ ASIZE and  $\rho$ CUD) can be specified according to the case at hand. Here, we set these values to their corresponding

<sup>&</sup>lt;sup>24</sup> For a summary on economies of scale in gas distribution networks, see Fabbri et al. (2000).

<sup>&</sup>lt;sup>25</sup> In 16 out of 26 companies the area size has remained constant.

estimates from the data. The first variant measures the economies of scale associated with an increase in output, when the number of terminal blocks and the area size and therefore the network are extended but the customer density remains constant, while the second variant includes the additional effect of customer density. Economies of scale 1 (Table 7) can be compared with its equi-proportional counterpart in Table 6. The results suggest that the scale economies may be overestimated if all changes are considered with the same proportion. As Table 7 shows, in both variants, the economies of scale are lower than one, suggesting diseconomies of scale. However, given that the estimates are sensitive to the adopted values for the proportions, these results cannot be generalized and should be considered with caution.

#### 7. Conclusions

The application of three cost frontier models to a five-year panel of 26 gas distribution companies in Switzerland suggests an average inefficiency of about 7% in the sector. This result is robust across all the models. The individual efficiency scores and ranks estimated from different models show a strong correlation. However, the companies identified as "best" and "worst" practices change across models. These results show that the mutual "consistency" requirements (Bauer et al., 1998) are not fully satisfied. Therefore, the individual efficiency estimates cannot be directly used as X-factors in the price-cap formulas.

However, the robustness of average efficiency estimates and also the cost function coefficients across different specifications suggest that the results can be used in setting target efficiency scores and cost prediction. The regulators can use such instruments to improve efficiency through yardstick competition.

The results also highlight the importance of environmental and output characteristics. Especially, the customer density, measured as the number of customers per kilometer of network, has a decreasing effect on costs, while the area size has a positive effect. As for the scale and density economies the results are more or less consistent with the findings of studies performed in other countries, in that they provide evidence of considerable density economies but insignificant or weak scale economies. This implies that distributors could decrease their average costs by increasing the output as long as they use the same network but the extension of networks does not result in any significant economies. Our analysis of variations over the sample period shows that the output characteristics do not vary at the same proportion as assumed in the definition of the scale economies. An alternative definition that accounts for the proportions estimated from the sample, suggests that the estimates of scale economies might be sensitive to the assumptions on the proportions between outputs.

#### **IGUA INTERROGATORY #19**

## **INTERROGATORY**

Reference: Enbridge Evidence, Exhibit "B", Tab 3, Sch 1, p. 1 of 37

Issue Nos.: 1.1 and 1.2

Issue 1.1: What are the implications associated with a revenue cap, a price cap and

other alternative multi-year incentive ratemaking frameworks?

Issue 1.2: What is the method for incentive regulation that the Board should approve

for each utility?

Enbridge does not include a stretch factor in its X factor proposal.

- (a) Does Enbridge believe that the sharing of efficiency gains and growth should be shared between customers and utility during the IR plan, or only upon completion of the term of the IR plan?
- (b) If Enbridge believes that the sharing of those efficiency gains and growth should be shared between customers and utility during the IR plan, how is this achieved without a positive stretch factor or an Earnings Sharing Mechanism ("ESM")?

#### **RESPONSE**

- a) The Company believes that the sharing of efficiency gains should occur upon completion of the term of the IR plan. Sharing efficiency gains through an arbitrary stretch factor only limits the Company's ability to invest in productivity enhancements in the first place. Further, enforcing the Company to share efficiency gains before any are even available further increases the Company's risk exposure.
- b) See part a) above.

#### **IGUA INTERROGATORY #20**

## **INTERROGATORY**

Reference: Enbridge Evidence, Exhibit "B", Tab 3, Sch 3, p. 12 of 64

Issue No.: 3.1

Issue: How should the X factor be determined?

Dr. Bernstein is of the opinion that omitting an X factor component designed to measure future changes in service use that differ from past trends will lead to an incorrect X factor. Dr. Bernstein is also of the opinion that the X factor calculation should account for prospective levels of infrastructure investment that differ. IGUA suggests that, on a prospective basis, there are other items from Enbridge's 2007 Board approved revenue requirement which will likely be lower during the term of the IR plan. In this context, please:

- (a) Identify all items contained in the 2007 board approved revenue requirement that will reduce below the 2007 level during the 2008-2012 time period.
- (b) List all of Enbridge's long-term debt instruments.
- (c) Identify which long-term debt instruments will expire during the 2008-2012 time period.
- (d) For all of the long-term debt instruments listed in (c), please provide the reduction in debt costs for the 2008-2012 time period if each instrument is renewed at an interest rate of 6%.

## <u>RESPONSE</u>

- a) Please see the response to Board Staff interrogatory #28 at Exhibit I, Tab 1, Schedule 28. Enbridge Gas Distribution has filed its incentive regulation application based upon 2007 Board approved as the base for future formulaic adjustments. The Company is not seeking any changes to 2007 Board approved revenue requirement.
- Please see table below for all of the company's long term debt instruments, associated maturities and effective rates.

## **INTERROGATORY**

Reference: Enbridge Evidence, Exhibit "B", Tab 3, Sch 3, p. 14 of 64

Issue No.: 3.1

Issue: How should the X factor be determined?

Dr. Bernstein states that the regulator cannot promise the regulated firm the fruits of its cost reducing efforts and then turn around and appropriate them at the next Price Cap Review. If the efficiency gains developed during the IR are not shared equally between the shareholder and the customers at the next Price Cap Review, and there is no stretch factor, and there is no Earnings Sharing Mechanism, will any of the benefits derived from the IR Plan flow to the customers? If yes, please explain.

## **RESPONSE**

Yes, for the following reasons. Under IR, it is possible that all parties (i.e., regulated firms, consumers, and the regulator) can be made better off. The regulated firm bears greater risk under IR in exchange for the prospect of greater reward. Consumers can typically realize price reductions (respectively increases) over time that are more (respectively less) pronounced than those experienced historically under rate of return regulation. The regulator benefits not only from more streamlined regulation, but from no longer being required to micromanage the regulated firm's operations.

One of the important characteristics of IR is a wholesale shift in risk bearing from consumers to the regulated firm. The regulated firm makes a commitment at the onset of the IR regime that calls for inflation adjusted prices or revenues to change on average at a rate specified by the X factor. In most cases, this X factor is chosen so that, when IR is first introduced, the decline in real prices over time is more pronounced than that realized historically under rate of return. If the regulated firm is able to reduce its costs over time at a rate that exceeds the X factor, its profits will rise; if not, the regulated firm's profits will decline and it may experience financial losses. In any event, the regulated firm has no recourse to petition the regulator for a change in rates on the basis of its own financial performance. Hence, consumers are guaranteed real price changes over time independent of the regulated firm's financial performance. In other words, consumers bear no risk. In contrast, IR regimes that incorporate provisions for

earnings reviews force consumers to bear greater risk by tying the prices they pay for services directly to the financial performance of the regulated firm alone.

As Dr. Bernstein stated in his evidence (pp. 12 - 13) consumers also benefit from escalating dynamic efficiency under IR. Increases in dynamic efficiency relate to such factors as infrastructure improvements and technological progress, which subsequently enable consumers to receive superior service offerings. However, the regulator could dampen incentives to undertake such improvements by appropriating the firm's cost savings and pass them on to consumers in the form of lower rates (equivalently, higher X factors). These short-term benefits must be balanced against the long-term losses to consumers measured in terms of foregone service improvements. Consequently, if the regulatory authority raises the X factor on the basis of the firm's earnings and thereby appropriates the firm's cost-reducing innovation, the firm has little incentive to undertake capital improvements and technological advances.

# **IGUA INTERROGATORY #23**

## **INTERROGATORY**

Reference: Enbridge Evidence, Exhibit "B", Tab 4, Sch 1, pp. 3 to 7 of 15

Issue No.: 5.1

Issue: What are the Y factors that should be included in the IR plan?

Enbridge has set out the challenges it will face with respect to capital investments, including residential customer attachments, natural gas fired power generation projects, repair and replacement projects, and reinforcement projects. As well, the company has set out its concerns with respect to declining average use. Given all of these challenges, why has Enbridge applied for an IR regulation model instead of a traditional Cost of Service Application?

# **RESPONSE**

Please see the response to CCC Interrogatory #9 at Exhibit I, Tab 3, Schedule 9.

#### **IGUA INTERROGATORY #26**

## **INTERROGATORY**

Reference: Union Evidence, Exhibit "B", Tab 1, p. 19 of 48

Issue No.: 1.2

Issue: What is the method for incentive regulation that the Board should approve for

each utility?

Union states that a Revenue Cap Mechanism may result in greater controversy and regulatory administration. Does Enbridge agree with this statement? If not, why not?

## RESPONSE

The Company believes that the revenue cap per customer is not controversial because it is appropriate for the circumstances faced by the utility and it is aligned with the outcomes expected by stakeholders.

This proposal involves an annual review of volume and customer addition forecasts as part of the annual review process. Whether the Company's proposal will result in greater regulatory administration than a price cap will depend on the exact nature of the price cap mechanism approved by the Board. The annual review improves transparency for all stakeholders.

## **INTERROGATORY**

Reference: Union Evidence, Exhibit "B", Tab 1, p. 19 of 48

Issue No.: 1.2

Issue: What is the method for incentive regulation that the Board should approve for

each utility?

Union states that price cap parameters that are known in advance will result in more stable and predictable rates than a Revenue Cap Mechanism. Does Enbridge agree with this proposition? If not, why not?

### RESPONSE

The parameters of the revenue per customer cap will be known in advance as they will be determined by the annual rate setting process, just as with a price cap.

#### **IGUA INTERROGATORY #28**

## **INTERROGATORY**

Reference: Enbridge Evidence, Exhibit "B", Tab 6, Sch 1, p. 1 of 4

Issue No.: 1.2

Issue: What is the method for incentive regulation that the Board should approve for

each utility?

IGUA has previously advocated that Union and Enbridge should file information equivalent to quarterly surveillance reports required by the NEB. In IGUA's view, the utilities should be required to provide the following information:

- (a) Financial Statements of both the utility and of its parent company (or, those portions of the parent company financial statements reflecting the utility's contributions)
- (b) Rate Base and Capital Expenditures, including:
  - (i) gross assets by function;
  - (ii) accumulated depreciation by function;
  - (iii) allowance for Working Capital by component;
- (c) Gas Delivery Volumes by rate class and by sales versus direct customers; and customer additions (number, by rate class, volume)
- (d) Revenue from operations, including:
  - (i) weather normalization;
  - (ii) by rate class;
  - (iii) unit revenues by rate class;
  - (iv) non-distribution revenue by source (storage, T-service, load balancing, miscellaneous fees);
  - (v) transactional services.
- (e) Operating Costs (excluding Cost of Gas)
  - Operations and Maintenance broken down by major cost elements (executive, information services, legal and regulatory, engineering, operations, buildings, communications, etc.);
  - (ii) Depreciation, Amortization and Depreciation;
  - (iii) Corporate Cost Allocation;
  - (iv) Income Tax, Corporation Tax, Capital Tax;
  - (v) DSM program costs.
- (f) Cost of Gas
  - (i) Average cost of gas purchases for sales customers;
  - (ii) Average cost of gas used in operations;
  - (iii) Lost and unaccounted for gas;

- (iv) Cost of transportation by upstream contract, both total and average/per unit cost.
- (g) Return on Equity (dollar and percentage)
- (h) Deferral Account Balances
- (i) Cost Allocation
  - (i) Allocation of costs by customer class
  - (ii) Allocation of rate base by customer class
- (j) Rate Design Schedules

Please identify from the information listed in (a) through to (j) which items Enbridge opposes to producing on a quarterly basis. For those items to which Enbridge opposes quarterly reporting, please provide an explanation.

# **RESPONSE**

Some of the items requested by IGUA are currently available for review on a quarterly basis through the filing of QRAM applications. This would include all or part of the information requested at part (f) Cost of Gas, (h) Deferral Account Balances and, to some extent, (j) Rate Design Schedules or more specifically, rate schedules.

Beyond the provision of this information, the Company would oppose the production of the balance of the material requested on a quarterly basis.

The Company has stated many times in recent years that the production and review of quarterly results, or year to date information at the end of each quarter, would not provide an incremental understanding of the events to date in comparison to the Board Approved annual revenue requirement for that year.

The Company does not follow budgeting or forecasting procedures that would require all employees with budgeting responsibility to review the quarterly results and reforecast their forecast to the end of the year in minute detail so as to provide relevant information that would stand up to a level of scrutiny which some might request or expect in the regulatory arena. This obligation would require the Company to increase its costs related to staffing and reporting requirements in order to accommodate the increased workload.

There would be other incremental costs that ratepayers would be required to bear such as an increase in the activity level of intervenors, the Board, Board Staff, and other stakeholders as they review, analyze, question, and challenge detailed and estimated cost of service type information at every step of the way during the year.

Witnesses: R. Bourke

K. CulbertA. KacicnikT. Ladanyi

Filed: 2007-09-04 EB-2007-0615 Exhibit I Tab 17 Schedule 28 Page 3 of 3

This information would also have to be disseminated throughout the organization, analyzed, presented for Board of Director approval and released to the financial community in compliance with financial and investment community rules and safeguards.

As stated in the evidence referenced at the outset of this interrogatory, the Company believes that the Board's reporting requirements during the term of the plan are sufficiently covered through a mix of Board rules and required reporting. The Company believes that the annual information it has proposed to provide to all other stakeholders during an incentive regulation term is appropriately matched to a basic premise of an incentive plan.

The Company submits that the provision of further detailed cost of service type quarterly information as suggested in this interrogatory, again the costs of which are not currently incurred by the Company or included in the base revenue requirement upon which incentive regulation rates will be set, is not cost effective or warranted.

The Company submits there should be a benefit of considerable magnitude which outweighs the cost burden which the Company's ratepayers would be faced with upon the Company and all stakeholders performing the accumulation, review, analysis, questioning, and challenging of such information, as previously shown would be required.

As stated in the Company's response to Board Staff Interrogatory #27 at Exhibit I, Tab 1, Schedule 27, if one of the intents of an incentive regulation plan is to reduce regulatory costs and burden and incent all stakeholders in the process to achieve efficiencies or alternate ways of doing things, then the continued accumulation of detailed cost of service type information, or in this case further imposed quarterly information reporting and detailed reviews of such information throughout the IR period and or at the end of the plan, is contradictory to that intent.

# **IGUA INTERROGATORY #30**

# <u>INTERROGATORY</u>

Reference: PEG Report, p. v

Issue No.: 1.2

Issue: What is the method for incentive regulation that the Board should approve for

each utility?

Enbridge has identified that a Revenue Cap Mechanism should be used. PEG has calculated a Price Cap Index and Revenue Cap Index for Enbridge.

- (a) If the Board determines that a Price Cap Mechanism is more appropriate than a Revenue Cap Mechanism, does Enbridge accept the Price Cap Index as set out in the PEG Report?
- (b) If the answer to (a) is no, please identify which components of the Price Cap Index set out at iv and v of the PEG Report Enbridge does not accept. For those components of the Price Cap Index that Enbridge does not accept, please provide an explanation.

#### RESPONSE

Please see the response to VECC Interrogatory #1 at Exhibit I, Tab 13, Schedule 1.
