#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #1 1 2 List 1 3 **Interrogatory** 4 5 1.1 Has Hydro One responded appropriately to all relevant Board directions from 6 previous proceedings? 7 8 Ref: Ex H1/Tab 5/Schedule 1/Page 2 9 10 Please provide the following information with respect to Hydro One's forecast of export 11 transmission service revenues: 12 13 A) A list of export transmission service revenues, by year, for the years 2005-2009. 14 15 B) The original Independent Electricity System Operator (IESO) transmission export 16 revenue forecasts for the years 2005-2009. 17 18 C) A detailed description of the forecasting methodology used by the IESO to 19 forecast export transmission revenues. 20 21 D) In a format similar to what Hydro One provides to confirm its load forecast 22 accuracy (Ex A/Tab 12/Schedule 3/Page 21/Table 5), please illustrate the 23 historical forecast accuracy for the Hydro One/IESO export transmission tariff 24 revenue forecasts. 25 26 27 Response 28 29 The response to parts B) and C) are provided by the IESO with input from Hydro One to 30 part B).

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 1 Page 2 of 3

A) Revenues received for export transmission service for the year 2005 to 2009 are as follows:

	2005	2006	2007	2008	2009
M\$	12.0	13.3	14.1	24.6	16.8

B) The IESO doesn't forecast transmission export revenue; however, the energy export forecasts were provided by the IESO for the years 2005-2009, as follows:

	2005	2006	2007	2008	2009
TWh	5.8	8.6	10.4	12.3	6.7

The export revenue forecasts assumed by Hydro One in its Transmission Applications are as follows:

			2007	2008	2009
	2005	2006	(note 1)	(note 1)	(note 2)
TWh	_	-	12	12	12

Note 1: Forecasts based on the actual 2005 level of exports as indicated in EB-2006-0501, Exhibit H1, Tab 5, Schedule 3, page 2, Updated February 23, 2007.

Note 2: Forecast based on export volumes included in the IESO's 2008-2010 Business Plan filed as part of the IESO's 2008 Rate Submission in Proceeding EB-2007-0816: (http://www.rds.oeb.gov.on.ca/webdrawer/webdrawer.dll/webdrawer/rec/19076/view/IESO\_2008\_Fe es\_Business\_Plan\_2008-2010\_Sept.27.07\_20071102.PDF)

C) The IESO forecast of export volumes for the 2005 forecast year was based on the previous 5-year (2000-2004) average of monthly exports. For the 2006-2008 forecast years, the export forecasts were based on 3-year moving averages of monthly exports.

For the 2009 forecast year, two adjustments were made to the 3-year moving average model used in the prior years. This was done in recognition of anticipated changes in market and system conditions that were expected to impact export volumes going forward. The two adjustments are described below:

i) The historical export data used in the 3-year moving average was limited to exports net of linked wheels. This was done in recognition of the relatively high volume of linked wheels experienced in the first half of 2008, which subsequently returned to normal levels following Federal Energy Regulatory Commission approval on August 21, 2008 of a New York Independent System Operator (NYISO) temporary proposal prohibiting the scheduling of external transactions over eight specified circuitous paths. This change to the forecast methodology was made because the high volume of linked wheels experienced in the first half of 2008 was not expected to reoccur in 2009. Furthermore, the export volumes associated with linked wheels prior to 2008 had been insignificant.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 1 Page 3 of 3

ii) Electricity exports in 2009 were expected to be lower as a result of government-directed limits on emissions from Ontario's coal-fired generation plants. The IESO anticipated that the reduction in exports due to coal-fired emissions restrictions for 2009 would be approximately 50% of the export forecast based on the 3-year moving average

Going forward, it is possible that the methodology for determining the export forecast will be subject to further revisions as market and system conditions continue to evolve.

1 2

#### **Response**

This response is provided by the IESO.

### A) B) C) D)

The IESO first initiated discussions with NYISO in 2007. Later it commenced discussions with Hydro Quebec and MISO. These communications continued until mid 2009.

NYISO was receptive to this initiative and indicated it would be interested in discussing it further, pending consultation with NY transmission owners, regulators and its stakeholders.

MISO was not receptive to this initiative; nor was Hydro Quebec. Hydro Quebec advised the IESO in May 2009 that it had no interest in negotiating or participating in any reciprocal arrangement because HQT's tariff was cost-based and applies uniformly to all types of energy transmitted in and out of Quebec.

The IESO intends to follow up with NYISO (and its other neighbors should their level of interest change) on this initiative but not in the near future. The incremental benefit of negotiating an arrangement with NYISO alone is not as great. The IESO will follow-up on this once it completes more immediate initiatives that are required to implement the GEA. In particular, the IESO is currently undertaking initiatives that are necessary to incorporate changes resulting from the GEA, including initiatives designed to integrate increased amounts of renewable generation in a manner that will maintain system reliability and operability (e.g., enable intermittent resources to be treated as dispatchable resources) and which will also contribute to mitigating potential SBG conditions. The IESO proposes that it focus on and complete these efforts before revisiting the matter of ETS tariff elimination with NY, and other neighbours as applicable.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 4 Page 1 of 2

### <u>Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #4</u> <u>List 1</u>

1.1 Has Hydro One responded appropriately to all relevant Board directions from previous proceedings?

Ref: Ex G1/Tab 2/Schedule 1

8 Ref: EB-2006-0501, Ex G1/Tab 1/Schedule 1/Page 5

In the current application, Hydro One refers to the rate making methodology articulated and approved in EB-2006-0501 and EB-2008-0272. The reference to EB-2006-0501 is the articulation of Bonbright's "Principles of Public Utility Rates" for rate making and Hydro One's use of same. The IESO study and summary do not appear to discuss standard rate making principles.

A) Please discuss how the cost allocation and rate design principles that have been approved by the Board have been reflected in the IESO study and recommendation.

B) Please discuss the decision criteria employed by the IESO and whether Hydro One provided any direction to the IESO with respect to how its own rate making principles were to be reflected in the IESO study.

#### **Response**

This response is provided by the IESO.

A) The IESO did not undertake a study (nor was it requested to do so) of potential alternatives to the cost allocation principles already approved by the Board and adopted in Ontario in respect of export transmission service. The rate design principles relating to the ETS tariff were approved by the Board in RP-1999-0044. Here the Board endorsed a tariff design that will contribute to maximizing the benefits of integrated regional electricity markets and trades. In particular, the Board noted that "[t]he Board does not accept that the EWT charge should be equal to the

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 4 Page 2 of 2

domestic charge, as advocated mainly by the environmental groups, since such a charge may frustrate the objective of working toward a larger, open power market." The IESO's recommendation is consistent with the Board's longstanding premise regarding the underlying basis of the export transmission service rate design principles approved by the Board in RP-1999-0044.

567

8

9

10

1

2

3

4

B) Please refer to the Section 3.0 of the ETS Tariff Report for an explanation of the decision criteria employed by the IESO. No, Hydro One did not provide any direction to the IESO with respect to how its rate making principles should be reflected in the study.

A) Please indentify any external (i.e., non – IESO or Hydro One) sources of funding for the ETS study, as well as the amount and purpose of the external funding.

8

7

B) Please describe how the IESO canvassed for and supported stakeholder involvement for the ETS study, particularly by groups representing customer interests.

12

13

14

15

16

11

10

C) Appendix B of Attachment 1 lists Hydro Quebec as a stakeholder participant in the ETS study process. Please indicate whether in this study proceeding Hydro Quebec expressed an interest in a mutual elimination of export tariffs and whether discussions have ensued.

17 18

#### **Response**

19 20 21

This response is provided by the IESO.

22 23

24

25

26

27

28

A) The scope of the IESO's review was expanded at the behest of stakeholders to consider two additional ETS tariff options (i.e., Unilateral Elimination of the tariff in all hours and only during off-peaks hours) and to review the potential impacts of each of the options on SBG events. Bruce Power contributed \$22,000 towards the ETS Tariff Study to help offset the additional cost of expanding the scope of the study. Review of the potential impacts on SBG events was not part of the initial scope of work.

29 30 31

32

33

34

35

36

37

38

B) The IESO announced that it was undertaking the ETS Tariff Study by way of its weekly bulletin to market participants. Also, the IESO sent a notification to all interveners in Hydro One's EB-2006-0501 Transmission Rate hearing. Stakeholder Working Group was subsequently established and administered in accordance with the IESO's Stakeholder Engagement Principles and Process. detailed description of the Stakeholder Engagement Principles and Process can be the website found on IESO's public the following link: http://www.ieso.ca/imoweb/consult/stakeholder principles.asp

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 6 Page 2 of 2

C) Hydro Quebec Trans-Energie did not express a view for or against mutual elimination of the export tariff between Ontario and Quebec during the course of the stakeholder consultation process. Discussions with Hydro Quebec Trans-Energie regarding reciprocal treatment of export tariff between Ontario and Quebec took place through other means. On May 26, 2009, the IESO was advised by Hydro Quebec Trans-Energie that it had no basis on which to engage in any negotiation or to participate in any reciprocal arrangements on ETS Tariff elimination. It noted that its tariff is of the cost-based type and applies uniformly to all kinds of energy flow in its jurisdiction (e.g., native load, exports, wheel-through transactions). There have been no further discussions with Hydro Quebec Trans-Energie regarding this matter since receiving this communiqué.

## Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #13 List 1

*Inte* 

#### **Interrogatory**

3.1 Are the proposed spending levels for, Sustaining, Development and Operations OM&A in 2011 and 2012 appropriate, including consideration of factors such as system reliability and asset condition?

### Ref: Ex C1/Tab2/Schedule 2/Appendix A

Please provide the most recent heath index information for the different asset components categories, as previously provided in EB-2008-0272 Ex D1/Tab 2/Schedule 1 and also in EB-2006-0501.

#### Response

Hydro One has not updated the previous health index information provided in EB-2008-0272 or EB-2006-0501, as the indices in themselves are not used to make specific investment decisions, except with Protection and Controls (P&C), i.e., high end electrical components. Health Indices for P&C are based primarily on trends in relay reliability from observed failure rates, rather than the condition based health indices that apply to most other asset categories. The failure rates of particular makes and models of relays are tracked through re-verification and event analysis and the current health index formulation lends itself to making investment decision on a class of assets such as with P&C, as opposed to equipment/component specific investments.

The health indices that were submitted in the previous filings referenced above would provide an overall view of the condition of asset groups. However, as noted in Exhibit D1, Tab 2, Schedule 1, page 10, a number of factors in addition to a health index are considered in determining the end of, or remaining life of an asset, as well as the need for specific investments. These are: reliability and performance, utilization, technical obsolescence, safety and environment, life cycle cost and age to some degree. Except for P&C, health indices are highly condition centric and they are indicators of an asset end of life, but there are other factors to consider as noted above. It is these other factors and the key inputs to the health indices that were used to establish the need for the sustaining investments as identified in Exhibit C1, Tab 3, Schedule 3 and D1, Tab 3, Schedule 2.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 13 Page 2 of 2

As noted above, specific investment decisions are to some degree based on the key 1 elements of a health index. For example, conductor end of life on overhead transmission 2 lines is based on tensile strength and ductility determine through a twist test. The results 3 from these tests were used to establish the need for the replacement of the conductor on 4 circuit A6P as detailed in Exhibit D2, Tab 2, Schedule 3, S38. Furthermore, Hydro One 5 has provided evidence concerning the decision process as noted in Exhibit D1, Tab 2, 6 Schedule 1 starting on page 12. The specific decision process for overhead conductor 7 replacement is highlighted on page 72 of this exhibit. 8

9 10

11

12

13

14

15

16

17

18

Certainly, correlating asset condition to actual asset failure or remaining life, and the risk posed to system reliability and customer supply remains an industry challenge. Hydro One has begun the work to better quantify and analyse the asset risks and correlate these to the need for specific investments. To update the former health indices is a significant effort, and it is Hydro One's view that our efforts are better spent improving the analytics and developing tools that will provide greater and more specific insight into the need for investments. Furthermore, with the recent implementation of SAP and the information it provides, and the added ability to analyse asset data, substantial improvements can be made in the assessment of end of life risks.

25	E)	<u>Page 19/Table 6</u> : Please identify the amounts Hydro One has spent/is
26		planning to spend on external consultants, contract staff and service providers
27		in the IT Management and Project Control category over the years shown.
28		
29	Dagnanga	
30	<u>Response</u>	

A) Yes, the three year extension to the Inergi contract includes requirements for

continuous efficiency improvements. These improvements are stipulated through:

• a continuous improvement obligations;

31

32

33

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 16 Page 2 of 2

- a service level methodology that allows for continuous performance improvement and increasing of service level minimums and targets;
  - a service level methodology that imposes fee credits for missed critical performance indicators;
  - a base cost reduction curve over the life of the extended contract; and;
  - a contract change management process that allows services to be modified to better align to changes in service requirements..
- B) Yes. Hydro One engaged an outsourcing advisory firm in 2009 through to contract extension finalization in 2010, to facilitate the negotiation process and to provide advice on outsourcing market practices. In doing so, they provided advice on what services and costs Hydro One should expect in a contract extension through comparison to other outsourcing arrangements. At the conclusion of negotiations in 2010, the outsourcing advisory firm provided Hydro One with a professional judgment that the agreement, taken as a whole, is market competitive.

In addition, the original agreement between Hydro One and Inergi contained a provision for regular benchmarking. In accordance with this provision, in November 2007, Hydro One engaged an external firm to conduct a benchmarking study to provide an independent assessment of the extent to which services provided by Inergi to Hydro One were being provided at a price no greater than Fair Market Value. The overall results of the benchmark indicated that Inergi's pricing was favorable to Fair Market Value.

C) No.

D) The \$9M refers to SAP application support cost which is the cost to Inergi for them to provide application support to the SAP application in accordance with the outsourced service contract. These costs do not pertain to monies provided to SAP.

The \$9M in SAP application support for 2010 and 2011 is contractually guaranteed with Inergi as of the extended contract. They cannot unilaterally raise this cost without undergoing a contract change management process with Hydro One to identify and agree on any proposed changes to service, scope and/or pricing.

SAP software maintenance costs payable to SAP AG are also contractually guaranteed over the test years.

E) In the IT Management and Project Control category, Hydro One spent \$2.6M in 2007, \$2.9M in 2008, and \$6.3M in 2009 on contract staff as well as for projects performed by external consultants and by Hydro One's outsourcer/service provider. For the years 2010, 2011, and 2012 the forecasted spend is \$6.8M, \$4.2M, and \$3.9M respectively. Projects in this category are primarily for implementing IT security enhancements and for end-of-life server and client hardware refresh.

\* No Board Approved amounts for 2006

B) There were no Board approved numbers to compare for 2006. The explanation of variances for 2007 and 2008 actual OM&A costs compared to the OM&A expenditures approved by the Board are summarized below.

#### 2007 Variances

Hydro One Transmission's actual 2007 OM&A costs were \$19 million higher than the \$394 million approved by the Board in Proceeding EB-2006-0501. This was due to a lower capitalized overhead credit of \$16 million and higher spending in response to storms and other unforeseen asset needs. The increase in OM&A costs were offset by a \$10 million decrease in Property Taxes and Rights Payments.

#### 2008 Variances

Hydro One Transmission's actual 2008 OM&A costs were \$13.7 million lower than the \$388 million approved by the Board in Proceeding EB-2006-0501. This difference was primarily related to decreases in stations sustainment costs and Property Taxes and Rights Payments offset by an increase in Shared Services related to an increase in cost of sales.

Interr	ogatory	
4.2	Are the pro	posed 2011 and 2012 Sustaining and Development and
	Operations	capital expenditures appropriate, including consideration of
	factors such	as system reliability and asset condition?
Ref: E	Ex D2/Tab 2/S	Schedule 3
4 >	<b>D</b> :	12
A)	•	33 appears to be virtually identical to project S2 in EB-2008-0272, the
	-	nent of 4 EOL metalclad circuit breakers in the GTA, along with
	1	ons and 15kV cables. At the same tie, the proposed budget of \$23.5M
	appears t	to be almost triple the \$8.0M budgeted for the same work description
	and the s	ame level of accomplishment in EB-2008-0272. Please explain this
	large var	iance.
B)	Project S	44 appears to be the same project S4 described in EB-2008-0272.
	Please ex	xplain the project extension and budget increase.
C)	Project S	7 (Orangeville TS ABCB Re-investment):
	i)	Is this project identical to project S5 in EB-2008-0272, or is it for
		an additional set of breakers?
	ii)	If this is a continuance of the previous S5, is the station service
		being replaced twice?
	iii)	If this is the same project, please explain the delay in completion
		and the cost increase of \$5.3M.
	iv)	If this is a continuing program, please explain the significantly

increased unit cost versus the previous S5.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 21 Page 2 of 4

1	
2	

3

4

D) Project S6 appears to be the completion of project S7 from EB-2008-0272, budgeted then at \$35.0M. If this is correct, please identify what the total budget was for this project and the variance, if any.

5

7

8

E) Project S15 appears to be for the same replacement work identified in Project S12 in EB-2008-0272 and scheduled for completion in 2009. If this is accurate, please provide an explanation of the variance and in-service delay.

9

10

11

12

F) Project S13 appears to be identical to Project S15 in EB-2008-0272, originally scheduled for completion in 2010 at a gross cost of \$9.5M. If this is accurate, please explain the cost escalation and the delay.

13

14

15

G) Project S20 (spill containment refurbishment): Please identify 2009 and 2010 costs and accomplishments (systems refurbished) for this program.

16 17

H) Project D2 (Kirkland Lake & Porcupine SVCs): Please explain the schedule extension and variance for this project.

19 20

18

I) Project D35 (Northwest Transmission Reinforcement):

21

 Please identify the current load in the Pickle Lake area that is served by Hydro One and which this reinforcement will also serve.

23 24 ii) Please identify how Hydro One plans to recover cost of this reinforcement from new customers, both load and renewable generators.

2526

iii) Please provide a breakout of the cost of the line, separating the cost to reach LJF and the wind generation on the East Side of Lake Nipigon from the extension to Pickle Lake loads.

28

27

iv) Please provide the expected capacity of the portion of the line from Lake Nipigon to Pickle Lake.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 21 Page 3 of 4

#### Response

1 2 3

4

5

6

A) When EB-2008-0272 was prepared and filed, Hydro One had not yet completed any metalclad circuit breaker replacement projects with THESL. Since that time, Hydro One has performed four separate metalclad replacement projects. Planned expenditures in the test years are for projects very similar to those completed in 2009 and 2010, and pricing has been updated accordingly.

7 8 9

10

11

12

13

14

15

16

B) The project in-service date has been extended due to the expansion of the scope of work, and as a result the planned costs have increased to meet the requirements of external stakeholders. Specifically, negotiations were required between Hydro One, OPG, IESO, and Parks Canada around issues such as the configuration of the new switchyard, the demerger of assets from the OPG powerhouse, available land for the construction of a new switchyard, interconnections to National Grid's system, and decommissioning of the 25Hz equipment. The project delays are attributed to the additional time required to incorporate the requirements of these stakeholders and negotiate property rights.

36

37

38

C)

S7 from EB-2010-0002 and S5 from EB-2008-0272 are the same project to replace end of life air-blast breakers at Orangeville TS. To gain efficiencies and minimize the required system outage time, Hydro One modified the project scope to account for both the Sustaining need to replace EOL assets and the Development need to reconfigure the existing bus configuration by adding a third 230kV diameter to improve system flexibility and reliability by terminating all incoming circuits into breaker and half configuration.

- iii) The project was delayed from the original in-service date by Hydro One for two reasons:
  - Allow time for the more complex project scoping and planning necessary to meet the Sustaining and Development program requirements
  - Allow resources and funding to be utilized for the completion of other high priority work, specifically P&C capital work associated with EOL asset replacements and the NERC cyber security regulations

The resulting cost increase from the previous filing is attributed to the larger scope of the project as discussed above, specifically the inclusion of the three new breakers, line re-terminations, and EOL instrument transformers.

iv) See part iii).

39 40 41

D) S6 from EB-2010-0002 is the same project as S7 from EB-2008-0272 for the Nanticoke 230kV ABCB replacements. The in-service date remains unchanged from previous filing as mid-2011. The total project capital cost remains the same as identified in the previous filing at \$31.0M.

43 44

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 21 Page 4 of 4

- E) S15 from EB-2010-0002 is the same project as S12 from EB-2008-0272 for the replacement of Leaside T19, T20, and T21 transformers. The in-service date for the complete project has changed from late 2009 to early 2012 as a result of the following:
  - The detailed project engineering phase revealed necessary expansions of the project scope, which also resulted in cost increases. This additional work includes modifications to the existing rigid bus work on both the high & low side of the transformers, and changing the LV bus work to a higher ampacity, allowing the transformer's overload capabilities to be fully utilized.
  - The procurement of the transformers took longer than expected, in part due to manufacturing and factory testing delays

The completion of the T21 portion of the project is expected in early 2011 and the remaining two transformers will be completed by early 2012.

- F) S13 from EB-2010-0002 is the same project as S15 in EB-2008-0272 for the replacement of Richview T7 and T8 transformers. The detailed engineering phase of the project revealed necessary expansion of the project scope, which resulted in capital cost changing from \$8.6M to \$9.2M. The expanded scope includes additional work to replace insulators within the transformer zone and install surge arresters in place of the existing rod-gaps. The in-service date has changed to 2012 from late 2010.
- G) 2009 actual capital costs were \$3.0M for work completed on 11 systems, and 2010 bridge year projected capital costs are \$2.8M for work on 6 systems.
- H) At the time of rate filing, the Kirkland Lake SVC in-service date was delayed, at the supplier's request. Major factors include: (1) delays in identifying the supplier's civil sub-contractor, (2) the discovery of "contaminated" excavated material at Site, and (3) delays in the submission of the Certificate of Approval oil containment/drainage engineering package to the Ministry of the Environment (Ontario).

This I/S date delay was expected to result in a potential cost increase and additional contingency was added to the project accordingly.

I)

- i) The current load at Pickle Lake is approximately 23 MW
- ii) If sufficient information and direction is provided Hydro One will continue to evaluate a number of alternatives to recover the cost of this project from interested stakeholders.
- iii) The estimated construction cost of the line from Nipigon to Pickle Lake is \$399.5M as presented in evidence. A breakout of the construction cost for the section from Nipigon to LJF (Auden) and the section from LJF (Auden) to Pickle Lake has not been done.
- iv) The thermal capacity of the line would be 400 MVA.

8 9

6

7

B) There were no Board approved numbers to compare for 2006. The explanation of variances for 2007 and 2008 actual Capital costs compared to the Capital expenditures approved by the Board are summarized below.

10 11

#### 2007 Variances

12 13

Hydro One Transmission's capital expenditures in 2007 were \$152 million below the total projected expenditures approved by the Board.

14 15 16

The reasons for the lower spending on Sustaining, Development and Operations capital programs in 2007 were attributed to the following:

17 18 19

 Redirection of resources as a result of a number of large unplanned events in The unplanned events included a building fire at Pickering TS, a transformer failure and fire at Pinard TS and capacitor bank transient voltage faults at Richview TS.

21 22 23

24

20

Redirection of resources from Sustaining in 2007 to complete demand-driven Development work (e.g. new generator connections and new load connections) and other externally mandated work.

25 26 27

Delays in completing the necessary engineering work as a result of difficulty in recruiting the required specialist engineering staff. This difficulty arose from competing demands from other organizations in Ontario, Alberta, and from international organizations recruiting to satisfy major global expansions in India. China and other rapidly expanding locations.

28 29 30

- Delays due to difficulty in getting the required outage approvals from the IESO as a result of transmission system limitations.
- 31 32 33
- Longer lead times to obtain key materials and equipment.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 22 Page 3 of 3

The primary reason Shared Services was under spent in 2007 was related to a delay in spending on the Cornerstone project from 2007 to 2008.

### 2008 Variances

Hydro One Transmission's capital expenditures in 2008 were \$70.2 million below the expenditure levels approved by the Board in EB-2006-0501. The lower spending on Development programs in 2008 was due to the same constraints as in 2007, in particular labour and material resource availability and the ability to get the outages required to do the work.

The constraints identified above were being managed by balancing short and long term risks in the re-assignment of priority work. Priority work included generator and load connection projects, major development projects at key stations, system interconnections, emergency repair work, work that was compliance driven and planned sustainment work programs. Although the re-prioritization of work had resulted in some reductions to Sustaining work programs, actions were being taken to increase work execution capacity and assisted in ensuring Hydro One Transmission can complete the full complement of work programs proposed for 2009 and 2010.

The higher than plan spending in 2008 on Shared Services was largely due to a shift in spending on Cornerstone.

*Interrogatory* 

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

Ref: Ex H1/Tab 3/Schedule 1/Page 1/Section 1.1, sub (1) "comprehensive impact analysis"

HONI requested that the Consultant provide a comprehensive impact analysis of the likely and potential effects, costs and benefits of implementing AMPCO's proposal.

A) Please provide estimates of the costs of implementing AMPCO's proposal, if any costs have been identified and such estimates have been made. If costs have not been estimated, please explain why such estimates were determined not to be within the scope of the required analysis of AMPCO's proposal.

B) Please provide estimates of the benefits of implementing AMPCO's proposal, if benefits have been identified and such estimates have been made. If benefits have not been estimated, please explain why such benefits were determined not to be within the scope of the required analysis of AMPCO's proposal.

C) Please explain, in the Consultant's opinion, the extent to which the AMPCO proposal is more or less likely, compared to the status quo scheme for network charge determinants, to promote efficiency in transmission or to promote efficient demand management.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 24 Page 2 of 3

D) Please provide an analysis, if any has been done, of the "localized transmission system impacts" of implementing AMPCO's proposal.

### Response

The response to parts B, C and D are provided by Power Advisory.

A) Please refer to Exhibit I, Tab 4, Schedule 63, part c.

B) Power Advisory estimated that implementing AMPCO's proposal would provide the following benefit: (1) reduced power supply costs from reductions in load during peak periods. This benefit was estimated to be about \$2.44 million in 2011 under the High Load Shift Case, \$1.71 million under the Central Load Shift Case, and \$980 thousand under the Low Load Shift Case. In addition, the High 5 proposal could defer network transmission system investments and reduce network transmission revenue requirements. However, Power Advisory didn't identify any network transmission investments that would be deferred and found that given the concentration of direct industrial customers, load reductions of sufficient magnitude to defer transmission investments are only likely to occur in areas where such investments are not needed.

C) As discussed, in our Report we don't believe that the High 5 Proposal would necessarily promote efficiency in transmission since in Ontario under the Green Energy Act transmission investment isn't necessarily promoted by increases in system peaks. However, over the longer term the load shifting promoted by the High 5 Proposal could promote greater efficiency in transmission. While the High 5 proposal would promote additional demand management, it isn't clear that the load reductions from this additional demand management are economically efficient, i.e., cost-justified. Therefore, it isn't clear that the High 5 proposal would promote more efficient demand management compared to the status quo.

D) Power Advisory evaluated the "localized transmission system impacts" of implementing AMPCO's proposal in Chapter 6 of its report. To assess the potential of AMPCO's High 5 Proposal to defer local transmission system investments we identified the conditions that are required to defer transmission investments, i.e., load reductions must be greater than forecast load growth. We then contrasted the likely levels of load shift in different transmission zones in Ontario with the likely level of load growth. This analysis indicated that "the only zones where the load shift is likely to be greater than the annual load growth are the Northeast and Northwest. The Northeast and Northwest zones offer the greatest potential load shift given the concentration of industrial load in these zones. However as discussed, actual forecast load growth in the Northeast and Northwest is negative and as a result there is

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 24 Page 3 of 3

unlikely to be any significant transmission investments in this area that are specifically attributable to incremental load growth other than new project-driven load growth which requires transmission investment to connect them into the IESO-controlled grid. Furthermore, these zonal loads are spread over large areas and as a result the resulting load reductions may not be sufficiently concentrated in the area where the transmission facility investment is required to defer the local area investment." (Power Advisory, Assessment of AMPCO's High 5 Proposal for Establishing Network Charge Determinants, p. 72). Furthermore, we discussed with Hydro One Transmission's system planners the load reductions that we expected the High 5 Proposal to produce. They indicated that load reductions of this magnitude would have no ability to defer any major transmission investments given that the load reductions would be spread across the Province roughly in proportion to the concentration of industrial load in different zones.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 25 Page 1 of 1

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #25 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1 9 10 Please provide the Consultant's analysis, including assumptions, input data sets, 11 calculations and results with respect to the effect of the AMPCO proposal on the 12 economic efficiency of the Ontario electricity market in total, relative to the status quo. 13 14 15 Response 16 17 This response is provided by Power advisory. 18 19 Power Advisory did not perform any quantitative analysis of the effect of the AMPCO 20 proposal on the Ontario electricity market in total, relative to the status quo. However, 21 we did identify commodity cost reductions from projected load shifts that indicate that 22 the High 5 proposal could result in reductions in electricity supply costs to consumers. 23 Lost profits to suppliers would need to be netted from these electricity supply cost 24

reductions to estimate the economic efficiency gains.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 26 Page 1 of 2

# Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #26 List 1

### **Interrogatory**

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

### Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page vi-vii

A) On table ES-3, the estimated load shifting is shown as 86 MW. Please identify the economic value to Ontario ratepayers that the Consultant has attributed to the avoidance of additional peaking generation, and include relevant assumptions, input data sets, and calculations.

B) The Consultant estimates that the average bill impact for a LDC residential customer would be \$2.40 per year. Please provide analysis in support of this estimate, including assumptions, input data sets and calculations.

C) Did the Consultant consider and quantify the extent to which rate increase for LDC customers could be implemented by way of changes to Time of Use rates so as to enhance load shifting? If so, Please provide the relevant analysis, including assumptions, input data sets, calculations and results.

#### Response

The response to parts A, B, and C are provided by Power advisory.

A) Power Advisory didn't estimate the economic value to Ontario ratepayers of avoiding additional peaking generation. However, Power Advisory analyses suggest that Ontario doesn't have a need for additional generation resources for capacity purposes until 2018 so there would not likely be benefits from avoiding additional peaking generation prior to this.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 26 Page 2 of 2

The average monthly bill of \$120 is based on an examination of data presented on the OEB web site at:

2 3 4

1

 $\underline{http://www.oeb.gov.on.ca/OEB/Consumers/Electricity/Your+Electricity+Utility/All+Electricity+Utility+Bills}$ 

5 6 7

B) Subsequent calculations are based on percentage components of the bill provided by Hydro One and the step-by-step calculation based on these inputs described on page 55 of the Power Advisory report. Thus:

9 10 11

12

13

14

15

8

- Transmission charges are approximately 7.5 % of the total bill or \$9/month
- Network charges are approximately 60% of transmission charges or \$5.40/month
- Network charges increase by 3.7% as shown on Table 15 (\$28.5 million increase on a base of \$763.6 million)
- A 3.7% increase applied to \$5.40 per month of network charges is \$0.20 per month or \$2.40 per year.

16 17 18

19

C) Power Advisory calculated average cost increases without regard to any specific rate design approach.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 27 Page 1 of 2

# Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #27 List 1

### **Interrogatory**

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

# Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 10/Section 2.1/Footnote 22

A) The Consultant suggests that the AMPCO proposal may result in a "reduction in market revenues to generators." Please provide analysis in support of the potential aggregate impact on generators (net of revenue changes and transmission cost changes) of implementing the AMPCO proposal, including assumptions, input data sets, calculations and results.

B) It is unclear whether the Consultant predicts that the net effect of the AMPCO proposal on the amount of Global Adjustment is likely to be positive or negative. Please clarify and provide supporting analysis, including assumptions, input data sets, calculations and results.

#### Response

The response to parts A and B are provided by Power advisory.

A) Power Advisory didn't estimate the magnitude of the reduction in market revenues to generators. However, the benefit to consumers of lower wholesale market prices is offset to a degree by a cost to generators in the form of reduced market revenues. In Ontario, a high proportion of electricity generation is under contract and the Global Adjustment Mechanism is used to compensate generators when market prices are below contract revenues. This mechanism reduces the revenue loss to generators but, since consumers ultimately pay the Global Adjustment, this mechanism also reduces the benefit to consumers from the lower prices.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 27 Page 2 of 2

B) Power Advisory expects that the increases in the Global Adjustment would offset a significant proportion of the commodity cost savings realized by consumers.

Specifically, while implementation of the High 5 proposal may cause HOEP to decrease, Power Advisory believes that a significant portion of this decrease would be offset by increases in the Global Adjustment.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 28 Page 1 of 1

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #28 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 16/Section 2.2.5 9 10 The last sentence of the first paragraph in Section 2.2.5 says, "A change in the charge 11 determinants for all LDCs (and not just HONI) as a result of the High 5 Proposal would 12 likely have dramatic impacts on the cost responsibility among all customers." 13 14 Please clarify whether this sentence is intended to characterize Hydro One's views as 15 expressed in EB-2008-0272 or is a statement of the Consultant's opinion? If it is 16 intended to characterize Hydro One's views, please provide the appropriate references. if 17 it is a statement of the Consultant's opinion, please provide supporting analysis, including 18 assumptions, input data sets, calculations and results. 19 20 21 Response 22 23 This response is provided by Power Advisory. 24 25 Although the sentence is incorporated into a section intended to objectively report the 26 comments of parties to EB-2008-0272, it is not reflected in comments filed by Hydro 27 One and should be interpreted as a statement of the Power Advisory's opinion. The 28

statement is based on Power Advisory's experience that a change in an allocation

methodology from one that reflects demands throughout the year to one that reflects

demands in relatively few hours within the year is likely to have dramatic cost

responsibility impacts among customers. This statement is not based on an analysis of

Ontario load data.

# Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #31 List 1

# **Interrogatory**

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

# Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 18/Section 2.3.1

On page 18 (Section 2.3.1), Power Advisory states, "These resources tend not to experience their maximum output at the time of peak demands and the transmission network must be designed accordingly."

A) Please provide the data and analysis of generation technologies and fuel types in Ontario, identifying which generation produces what during peak times, including information related to installed and/or available capacity (MW) and production (MWh).

B) Please identify (by dollar value and proportion of total) the existing assets in the network pool that can be attributed to accommodating generation that experiences maximum output at times other than the time of peak demand.

#### Response

The response to part A is provided by Power Advisory.

A) Power Advisory has not developed these data. However, based on our professional experience all available generation types, except for the very highest cost generation resources or energy limited resources that are saving their output for the super-peak period, produce during peak times.

B) The transmission system is designed to accommodate a varying number of operating conditions, one of which is the need to accommodate generation connected to the system. Many factors affect the dispatch of generation including resource type and

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 31 Page 2 of 2

market conditions. Depending on the generation dispatch behaviour within and external to Ontario, different parts of the system may be stressed at periods that may not coincide with times of peak demand. The transmission system needs to accommodate a wide range of system conditions over time. As such, it is not possible to identify Network assets specifically attributable to the situation referenced.

Dec	415	139	369	190	418	148	

B) Computing the shadow price of network services for each customer in each month would be a difficult and onerous undertaking.

Power Advisory understands "shadow price of network services" in this context to refer to the value to the customer of a 1 MW reduction in demand at the time of system peak (if the customer pays for network services based on monthly coincident peak) or at the time of its non-coincident peak demand (if the customer pays for network services based on the 85% ratchet.) Computing this value for each customer would require enough information to determine its demand at the time of the system peak as well as its own peak demand, in order to determine when the reduction has value. The computation would also require enough information to determine whether the reduction shifted the customer from ratchet to coincident peak when establishing their cost responsibility for network transmission charges.

Essentially, this would require hourly data for each month of the three years for the approximately 600 Hydro One delivery points. The analysis would then be done for each customer individually. This is an onerous task and the computations have not been done.

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

8

7

# Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 19/Section 2.3.2

10

- The report says, "Even setting aside the relatively low explanatory power of the industry-
- specific equations, greater effort should be devoted to addressing potential econometric
- model specification problems."

14

Please identify the potential econometric model specification problems to which this statement refers.

17 18

### **Response**

19 20 21

This response is provided by Power Advisory.

22 23

24

25

26

27

28

29

The most important econometric specification problem, as indicated by the low R<sup>2</sup>, is that important explanatory variables have been omitted. This equation uses only the price of the two inputs of off-peak and on-peak electricity (with some monthly dummies) to explain industrial electricity use. Since, as we point out in the answer to Exhibit I, Tab 9, Schedule 51, electricity is a factor of production, other explanatory variables could include factors influencing the firm's level of production or choice of inputs. For example, an activity variable such as demand for the firm's product should help explain its electricity use.

303132

Second, the two independent variables chosen can be expected to be correlated with each other, rendering any estimated coefficients subject to unknown bias.

33 34

More broadly, the development of this econometric equation does not start with any model of the system to be estimated and therefore has no theoretical basis for the specification of the variables.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 35 Page 1 of 1

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #35 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 9 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 19/Section 2.3.3 10 Section 2.3.3 of the report reads in part, "Moreover, the econometric equation used to 11 estimate this relationship is based on a data set that does not suffer from the same 12 13 shortcomings of the industry-specific elasticity equations." 14 Please identify and describe the shortcomings to which this statement refers. 15 16 17 Response 18 19 This response is provided by Power Advisory. 20 21 This statement was meant to refer to the applicability of the results of the two sets of 22 equations. The range of data in the estimation of the relationship between price and 23 aggregate demand clearly included the levels of demand to which its coefficients were 24 applied to estimate changes in price. However, the prices to which the coefficients of the 25 demand equations were applied were well outside the range of the data used to estimate 26

them. Extrapolation of empirically estimated structural coefficients so far beyond the

range of data used to estimate them may produce invalid results.

27

1

2

3 4

5 6

7

8

9 10 along the supply curve, an econometric model can be effective. Such a supply curve would represent a situation where an electricity supply system has a wide variety of suppliers with distinctly different cost functions.

B) That is not Power Advisory's opinion, as noted above in the answer to Part A).

C) Power Advisory's preferred methodology remains that chosen for, and reported on, in its report: the construction and use of an optimal-dispatch model with representation of the supply and demand conditions in the electricity system being modeled.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 37 Page 1 of 1

# Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #37 List 1

Interrogatory

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

### Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 20/Section 2.3.5

A) Please provide any information that the Consultant or HONI has with respect to the prevalence of demand ratchets as a feature of network charges in other jurisdictions, in particular whether the use of ratchets is widespread, increasing or decreasing.

B) Please provide any comparative analysis, including assumptions, data sets, calculations and results that the Consultant has performed with respect to the effect of ratchets for network charges. Such comparative analysis may include before-and-after comparisons within a jurisdiction before and after adopting a ratchet or between jurisdictions with and without ratchets.

#### **Response**

The response to parts A and B are provided by Power Advisory, with input from Hydro One on part A.

A) Power Advisory did not gather information regarding the presence of demand ratchets in other jurisdictions. Based on a review of transmission tariffs in other jurisdictions completed in June of 2006, it is Hydro One's understanding that demand ratchets for Network Service exist in New Brunswick, Nova Scotia, New Zealand and for some utilities in Australia.

B) Power Advisory did not perform any comparative analysis regarding demand ratchets among jurisdictions.

9	Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 20/Section 2.3.5
10	
11	The Consultant's report states, "The ratchet captures the fact that the transmission system
12	has been built over time based on the need to meet system peaks but also to meet the
13	peaks of large customers, regardless of when those peaks occur."
14	
15	Please provide appropriate references to substantiate the statement of fact contained in
16	this sentence.
17	
18	
19	<u>Response</u>
20 21	This response is provided by Power Advisory.
22	11110 100point to provided by 1 on 01 114 (1001).
23	Demand ratchets ensure that customers make a contribution to the recovery of fixed costs
24	even if they do not consume electricity during coincident peak periods, where such
25	coincident peak periods are used to establish cost responsibility, as in Ontario.

Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #40

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 41 Page 1 of 2

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #41 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 22/Section 2.3.5.1 9 10 The Consultant's report states, "There may be other, more targeted approaches that 11 accomplish greater demand response in a more efficient manner and without such 12 13 unintended consequences." 14 Please explain the mechanism by which the Retail Transmission Service Rates charged 15 by LDCs to Large Users and other monthly-billed customers are adjusted and how they 16 might vary from the network charge determinant methodology approved by the Board for 17 transmission customers. 18 19 20 Response 21 22 The Retail Transmission Service Rates (RTSR) charged by LDCs to Large Users and 23 other monthly-billed customers are adjusted through a rate application by an LDC to the 24 OEB. RTSR are adjusted at the same time as distribution rates are adjusted by 25 distributors. 26 27 Distributors adjust the RTSR after new Uniform Transmission Rates (UTR) have been 28 approved by the OEB. The OEB Guideline G-2008-0001 Revision 2.0, issued July 8, 29 2010, suggests that distributors adjust their RTSR for the new UTR levels and revenues 30 generated from existing RTSR, 31 32

(http://www.oeb.gov.on.ca/OEB/ Documents/Regulatory/Guideline G-2008-

3435

0001 EDRTSR.pdf).

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 41 Page 2 of 2

The RTSR Network charge determinants applied by distributors are described in the First

- Generation Performance Based Regulation for Electricity Distributors Distribution Rate
- Handbook, Chapter 11, section 11.3.2.5 Charge Determinants, Retail Transmission
- 4 Network Service Rate:

#### (http://www.oeb.gov.on.ca/documents/cases/RP-1999-0034/chapter11\_revision2.pdf)

"For an interval metered customer, the network rate will apply to an individual end-use customer's non-coincident peak demand in the month during the peak period defined as between 7 AM and 7 PM on weekdays that are not statutory holidays. For end-use customers with non-time-of-use demand meters, the network charge rate will apply to the customer's peak demand during the billing period. For customers with energy only meters, the network charge rate will be based on monthly energy, adjusted for losses, subject to a distributor's election under section 11.3.2.4."

13 14 15

2

5

6

7

8

9

10

11

12

Transmission connected customers are billed for Networks charges based on the highest of:

16 17 18

19

20

- Customers' demand at the time of the monthly coincident peak demand during the peak hours during business days, and
- 85% of maximum non-coincident demand during peak hours during IESO business days.

212223

24

25

26

Transmission connected customers and demand billed distributors' customers are both billed based on monthly consumption, but demand billed distributors' customers are not billed based on coincident demand and are not subject to the 85% demand ratchet when they are billed for RTSR.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 42 Page 1 of 1

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #42 1 2 List 1 3 **Interrogatory** 4 5 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 8.1 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 23/Section 2.3.5.2 9 10 The Consultant's report states, "For example, an increase in demands placed on the 11 transmission network from extreme weather may lead to greater unplanned outages of 12 13 equipment that requires maintenance, repair or replacement that exceed the budgeted amounts." 14 15 Please explain, with supporting analysis, whether the AMPCO proposal is more or less 16 likely, compared to the current scheme, to create incentives for demand response during 17 periods of extreme weather-related increases in demand. 18 19 20 Response 21 22 This response is provided by Power Advisory. 23 24 The High 5 proposal will provide a greater incentive for demand response during extreme 25 weather than the current rate design methodology, particularly for customers that 26 correctly anticipate the transmission price signal and have the ability to modify their 27 usage patterns. It is likely that extreme weather conditions will provide a signal to these 28 customers that both their energy and transmission charges are likely to be effected by 29 such conditions. 30

1	Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #43
2	<u>List 1</u>
3 4	<u>Interrogatory</u>
5	
6	8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the
7	status quo charge determinants for Network service?
8	
9	Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 24/Section 2.3.5.2
10	
11	The Consultant's report states, "The determination of the High 5 hours, and network
12	charge determinants would not be available until some time after the beginning of the
13	year. As it is possible that a High 5 hour could occur in January or February, it is
14	important the new rates be established as early in the year as possible. If this can only be
15	accomplished with a hearing process, in order for stakeholders to comment on the
16	calculations, then this becomes problematic."
17	, 1
18	A) Please provide analysis, including assumptions and data sets, in support of the
19	statement that the determination of the High 5 hours would not be available until
	"some time" after the end of the year.
20	some time after the end of the year.
21	
22	B) Under the High 5 proposal, a customer's charge determinant is based on demand
23	in the previous year. Please explain why the High 5 could not be implemented in
24	a way that is consistent with the notion that "it is important that new rates be
25	established as early in the year as possible".
26	
27	C) Please confirm that the Consultant expects that new rates would necessarily be set
28	through an annual hearing process.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 43 Page 2 of 2

1 2

#### **Response**

3 4

The response to parts A, B and C are provided by Power Advisory.

5 6

A) and B)

7 8 9

10

11

12

13

Final hourly demands for a calendar year are generally not available until settlement and verification activities have been performed and would not be available on December 31. However, Hydro One has subsequently discussed this issue with the IESO and confirmed that once the IESO has completed all the necessary system changes to be able to bill customers for Network costs based on the High Five proposal, the required data would be available in time to calculate January bills based on the High 5 peaks that occurred in the preceding year.

14 15 16

17

18

C) Power Advisory agrees that a regulatory action is necessary to recalculate rates. However, Power Advisory does not have an opinion with respect to the complexity of such a process, the degree of stakeholder involvement, or the necessity of hearings.

19 20

10		
11	Please provide the data/analysis or an appropriate reference for the 550 MW per degree	
12	Celsius figure.	
13		
14		
15	<u>Response</u>	
16		
17	This response is provided by Power Advisory.	
18		
19	This figure is used by OPG in its demand forecasting for Ontario. The IESO forecasts	
20	peak load using a heat and humidity index which considers both temperature and	
21	humidity (measured as dewpoint). The IESO estimates that peak load increases by 450	
22	MW for each degree C above 16 degrees C and by 160 MW for each degree increase in	
23	the dewpoint above 16 degrees C. Recognizing that high temperatures and humidity are	
24	highly correlated supports the 550 MW per degree Celsius figure estimated by OPG.

	<u>List 1</u>	
Inte	<u>rrogatory</u>	
8.1	Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the	
	status quo charge determinants for Network service?	
Ref:	Ex H1/Tab 3/Schedule 1/Attachment 1/Page 38/Section 3.2.2	
On p	page 38, the Consultant's report states, "Chief among the problems is the lack of a	
prop	erly formulated production function to constrain the system and the failure to	
cons	ider that the response to price change is to change the ratios of the inputs. The	
custo	omer is reacting to a change in the relative price of two of its inputs by rebalancing	
their	use, shifting away from the one that became relatively more expensive and towards	
the o	one that is now relatively cheaper. At the same time, we are assuming that the	
cust	omer plans to maintain its total output, which places a restriction on the way that the	
subs	titution occurs. To represent this situation properly requires development of a	
prod	uction function in a form consistent with the assumptions. Dr. Sen failed to	
_	construct any production function and therefore places no constraints on the results."	
Plea	se provide the economic theory behind using a production function with respect to	
anal	yzing consumption data.	
Kesp	<u>ponse</u>	
This	response is provided by Power Advisory.	
For	industrial austamore aleatricity is a feater of production. The amount of electricity a	
	industrial customers, electricity is a factor of production. The amount of electricity a omer uses depends on the technical and price relationships between electricity and	
	other factors of production; in other words, on the production function.

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #52 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 38/ Section 3.2.2 9 10 A) Please provide data and/or analysis to support the assumption that customers 11 who undertake load shifting will be constrained by maintaining output 12 constant. 13 14 B) Please explain whether the assumption requires daily output to be held 15 constant, or output within a week, month, quarter or year. 16 17 C) Please provide data, or appropriate references to a source of publicly available 18 data, that would enable the following proposed models to be estimated: (i) a 19 production function with a constant output constraint, or (ii) a production 20 function with a constant electricity budget constraint. 21 22 D) Please explain how a firm production function can be used to estimate 23 aggregate industry responses to changes in relative prices. 24 25 26 Response 27 28 The response to all parts is provided by Power Advisory. 29 30 A) Power Advisory does not assume customers will be constrained to maintain constant 31 output. As discussed in Exhibit I, tab 9, Schedule 53, we expect that the customer 32

would not want to change output, since its demand has not changed and its costs

have, if anything, decreased. Power Advisory said that the model system underlying

33

34

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 52 Page 2 of 2

the empirical estimation should be constrained to hold output constant to represent the conditions of production for the firm.

234

1

B) The constrained function would hold output constant over the period of shifting, in this case over a day.

5 6 7

C) Power Advisory has no such data. Such studies have generally not used publicly available data but rather have had access to individual customer data.

8 9 10

11

D) The responses to changes in relative prices are estimated from the empirical results of econometric estimation of the demand equations derived from the production functions of the firms.

12 13

### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #53 List 1

2 3 4

1

#### **Interrogatory**

5

8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the status quo charge determinants for Network service?

8

7

#### Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 38/ Section 3.2.2

10

11

The report states, "This would imply that the customer is reducing its output in response to the transmission price increase, which violates the assumptions of the analysis".

12 13 14

15

16

17

Please clarify that the analysis of which the assumptions are supposed to be violated in this sentence refers to the hypothetical analysis of a production function model as recommended by the Consultant, and not to any analysis which has actually been performed by AMPCO.

18 19

#### Response

202122

This response is provided by Power Advisory.

2324

25

26

27

28

29

The change in network transmission pricing does not change the conditions of demand for the company. It also should not increase the company's costs; in fact, it should decrease the cost. Since the company's overall demand curve has not changed, and its supply curve has if anything shifted downward, the assumption is that it will maintain its level of output. In making temporary shifts of production from peak to off-peak, the company is not likely to be changing its production technology so as to change the electricity/output ratio. Therefore, the expectation is that the company will keep its total electricity use for production of goods unchanged.

313233

34

35

AMPCO made a similar assertion. In AMPCO's report, it stated "Intuitively one can understand that where a customer reduces demand during peak hours, lost production must be made up during off-peak hours." <sup>1</sup>

\_

<sup>&</sup>lt;sup>1</sup> AMPCO, "The Benefits of Improvement in Transmission Rage Design", pg. 7

#### EXECUTIVE SUMMARY

From 1989 until 1992 there has been a de-emphasis of the demand charge and energy rates have been time differentiated. Higher rates are charged during the peak periods on weekdays and in the winter relative to the summer.

With econometric models, the TOU impacts on Ontario Hydro's direct industrial customers are estimated by controlling for other factors such as economic fluctuations and relative wage differentials. This report presents the 1992 cumulative and net TOU impacts on direct industrial customers. The study confirms that there were TOU impacts on half of the direct customers.

The 1992 cumulative 16-hour December Peak TOU impacts on direct industrial customers was approximately a 39.5 MW or 2.1% reduction. This was a decrease in TOU impact since the corresponding 1991 impact was a 45.8 MW or 2.4% reduction. At the industry level, the largest shifter was the Mining industry with a 18.88 mw reduction. It was followed by the Paper & Allied industry with a 7.09 mw reduction. Direct customers from the Non-Metallic Mineral, Primary Metal and Fabricated Metal Products industries also shifted more than 2 mw each.

On the energy side, the reduction in the overall winter energy consumption (15,130 average monthly Mwh) was coupled with an increase in the overall summer energy consumption (12,951 average monthly Mwh). This translated to an annual average monthly reduction of 1,089 Mwh for all direct customers in 1992.

Since direct customers in some industries represented the majority of these industries' load, we have reported their results as industry results in addition to firms' results. We have also reported the underlying firm and industry elasticities. Beside being valuable for ex-post assessment, the models and their results (eg. elasticities) are of value for scenario and simulation purposes. Different price and economic structure scenarios can be simulated.

#### ACKNOWLEDGEMENT

We would like to thank Louis Neretlis for computer programming. We thank Jim Pressnail and Gary Timoshenko for their contribution to data collection. We would also like to thank Jing Zhu for her dedication in the initial stages of the project. Kathy Chan's coordination of the computerization and data collection was very helpful.

We greatly appreciate Bob Bryniak's (Industrial Program Section) continuous moral and financial support for this project. We are grateful to Ralph Whiting, Paul Burke, Bill Harper and others for their valuable comments. Mike Roger's advice for creating non Time-of-Use price scenarios has been most helpful. In addition, this report would not have been possible without the on-going direction, commentary and financial support of Neil Mather of Load Analysis Section and Takis Plagiannakos of Energy Economics Section.

#### 1.0 Introduction

Until 1989, for its large industrial customers (known as directs), Ontario Hydro had a Hopkinson Structure which consisted of a monthly demand charge and a uniform energy rate. For the maximum 1-hour use the demand charge was paid, and a uniform energy charge was paid across the month and over all months of the year. From 1989 and on, there has been a de-emphasis of the demand charge and energy rates have become time differentiated. Higher rates are charged during the peak time period on weekdays (7 am - 11 pm) and in the winter relative to the summer. Table 1 provides a description of the rate structure.

Because of the multi-dimensional aspects of the rate structure, we find it convenient, at least on the energy side, to focus on two aspects of the resultant impact, the impact on time-of-day consumption and the impact on overall consumption. First, because of the widening peak:off-peak price differential we would expect reduction in peak consumption and increase in off-peak consumption. Second, because of the higher winter seasonal rates we would expect some conservation to occur in the winter - in both the peak and perhaps the off-peak. In the summer, the generally lower rates coming from the summer seasonal rates and perhaps even from shifting into cheaper off-peak electricity could result in an overall consumption increase. In addition, we must also consider impact of de-emphasizing the demand charge. This would encourage higher one-hour peak demand and less energy. In all, we can summarize the partial expected impacts in Table 2. Many of the net impacts, with the exception of peak energy consumption in the winter and peak demand in the summer, are in doubt.

The purpose of this report is to econometrically quantify the impact of the rate structure up to 1992 for direct customers. Since direct customers in some industries represented the majority of the industries' load, we can report their results as industry results. Individual customer results are provided in the Appendix. The TOU impacts estimated in this report were due to the TOU rate structure and net of economic fluctuations. We modelled customers responses to TOU while controlling for other non-price variables such as economic variables.

#### 2.0 Methodology and Selection Criteria

Under time-of-use rates, in a given month the industrial customer pays a one-hour peak demand charge (PKW) for maximum one-hour consumption (KW). The customer also pays a peak-energy charge (PKWP) for peak energy consumption (KWHP) and an off-peak energy charge (PKWHOP) for off-peak energy consumption (KWHOP). For this analysis we create mutually exclusive commodities - excess demand (X1=KW-KWHP/352), peak energy (X2=KWHP), and off-peak energy (X3=KWHO). The respective prices of these mutually exclusive commodities are P1=PKW, P2=PKWHP+PKW/352 and P3=PKWHO. For the interruptible customers, marginal (interruptible) rates are used.

In our analysis we viewed firms as choosing their individual electricity components, excess demand (X1), peak energy (X2) and off-peak energy (X3) to minimize their electricity expenditure subject to delivering a certain level of electricity service (E). We model (Xi/X1) as a function of P1, P2, P3, W1, W2, W3, SH, SP, T and E where the Wi (i=1,2,3) reflect wages during the day, afternoon and night, SH is the level of shipments, SP is a splined monthly dummy and T is time which represents technological or structural change. Furthermore, we model E as a function of P, W1, W3, W3, SH, SP and T where P is an overall price index of electricity (e.g.  $\ln P = \sum_{i=1}^{3} (PiXi/\Sigma PjXj) \ln Pi$ ). See Mountain and Zhu (1991) for a more detailed discussion of the econometric methodology.

There are two tiers for measuring responsiveness to TOU rates. Immediately below we will describe how we will select empirical functions (a two-equation model) to allocate the TOU impacts on the electricity components (e.g. off-peak kwh:peak kwh, demand: peak kwh). Of course, there is the possibility that TOU rates influence the firm's electricity consumption even though ratios of components do not change. To account for this, we add a single equation model (Aggregate Electricity Demand model) to account for impacts on total electricity consumption due to the possible change in overall electricity price index relative to prices of other forms of energy. From here on we will refer to this as the relative energy price effect. We will now describe briefly our modelling of the three electricity components.

As mentioned in Mountain and Zhu (1991), given our lack of knowledge about the actual representation between a target set of inputs and a set of independent variables and given the potential limited degree of variation in the data, we use a combined structural and flexible approach. We will try to let the data speak for itself but will also where possible, use economic theory to select simple (as opposed to more complicated) modelling systems. Even where we consider more structural models we will be comparing them with an unrestricted functional form where the data is allowed to speak for itself. While the dependent variable of the structural

models is (Xi/X1), the dependent variable of the flexible model is (Si) which represents the share of cost for each commodity. Please see Mountain and Zhu (1991) for details.

Given that we are uncertain about whether TOU rates matter or not, we will cautiously begin with two of the simplest functional forms which display no substitution response to TOU rates (Leontief) and an elasticity of substitution equal to 1 (Cobb-Douglas). If one of the above functional forms does not statistically significantly differ from an unrestricted data describing functional form, it is selected as the appropriate functional form. Otherwise, we continue by testing the Constant Elasticity of Substitution and Linear Constant Relative Share formulations of the Quasi Cobb-Douglas specification. We begin by conducting the above tests under the assumption of Hicks neutral technological change. If all of the above cases are rejected, the procedure is duplicated to allow for technological change.

If none of the above models is selected, we then perform a similar search on more flexible Translog specifications. Here we begin by testing for the presence of Cobb-Douglas and proceed to the more general Translog case. Again, the same test for technology is applied as just described. In all of the above, a function displaying Hicks neutral technological change is chosen over that with some biased form of technological change. This is consistent with our simplicity tenet. If no functional form is chosen that satisfies the above condition, we then use the Akaike Information Criteria (AIC) and choose the functional form with the lowest AIC test-statistic.

Some further comments on the specification search deserve mentioning. To balance "the desirability of not estimating an overparameterized model with the sensitivity of the procedure of rejecting a false null hypothesis", (Mountain and Hsiao 1989), we allow for higher type-I errors in testing more restrictive functional forms. (e.g. Leontief, Cobb-Douglas). Furthermore, given our prior view that firms either do not respond or indeed move their electricity consumption from the peak to the off-peak (and not view versa), we never choose a functional form with negative own-price elasticity of demand.

#### 3.0 DATA

Data periods are 1982-1992 or 1985-1992 depending on the availability of data for customers. The data sources are as follows: load data from the Program Testing and Analysis Department, electricity prices from the Rate Structures Department, shipments data and industrial selling price indexes from Statistics Canada, firm-specific wage data from the Ontario Ministry of Labour.

#### 4.0 RESULTS

This report will focus on the 1992 cumulative and net TOU impacts. Highlights of the results are summarized in the following sections while details of the results can be found in Appendix A. As Table 3 indicates, direct customers represented significant load contributions (about or above 50%) in the Mining, Primary Textile, Paper and Allied, Non-Metallic Mineral, Refined Petroleum and Coal and Chemical and Chemical Products industries. Therefore, discussion will concentrate on these industries.

#### 4.1 MODEL

#### 4.1.1 Model Selection

As mentioned in the methodology section, customers' TOU responses are assessed according to their conformity with the given list of two-equation functional forms as well as their sensitivity to changes in relative energy prices in the Aggregate Electricity Demand model. Five functional forms were identified (see Table 4). They were Leontief, CES, Linear, Cobb-Douglas, and Translog.

Leontief customers are insensitive to the price differential between the peak and off-peak periods and do not shift electricity consumption after the implementation of TOU rates. Sixty six customers were identified with Leontief functional forms and were distributed across industries.

The 36 customers which responded to the TOU price differential could be grouped under four different functional forms. While CES, Linear and Cobb-Douglas reflect constant elasticity of substitution between the three electricity commodities, Translog suggests a range of elasticities of substitution between the commodities.

As the TOU rates are implemented, customers may change their overall electricity consumption because of the change in relative energy prices. The Aggregate Electricity Demand Model helped to determine 29 customers' responsiveness to changes in relative energy prices (see Table 5). Twenty two of them were Leontief customers. Essentially, they changed their overall consumption levels but did not change their profiles. The remaining seven also responded to the TOU price differential and changed their profiles.

#### 4.1.2 Model Statistics

In estimating the system of relative electricity inputs, it is inevitable that econometrically estimated consumption will differ from the actual by an error. Because the overshooting of one set of relative inputs results in the undershooting of another set, the respective errors are correlated. This cross-covariance of errors is accounted for in the full information maximum likelihood estimation procedure. Given this estimation procedure there are various ways one might measure goodness of fit. We can certainly report the equation-by-equation R-square. The advantage of this is that we are measuring the variation in relative inputs in their original units. On the other hand, the estimation procedure involves a criterion of minimizing a weighted variation in relative inputs. Consequently, another relevant R-square is a system Rsquare which incorporates these weights (which are functions of the error-covariance structure) (see Judge, Griffiths, Hill, Lutkepohl and Lee, (1985). Both types of R-square are reported in Table 6 (see Table A2 for details). Given the criterion of estimation, it is not surprising that the system R-squares are usually high (around 0.95). The average R-square for the individual equations is 0.40. This is not unusual for monthly system models.

In addition to electricity prices, other non-price economic factors such as shipments, wages and seasonality affect customers' ability to shift out of the peak period. Although separately only about 31% of the non-price variables had effects on customers electricity consumption, jointly 58% of them exhibited such influence. The Primary Textile and Paper & Allied industries seemed to be strongly affected by non-price economic factors (see Table 6).

Shipments have the weakest relationship with customers demand for electricity for two reasons. Although the variable "shipments" on average is the closest proxy to output, it may not be true for some customers. Furthermore, industry shipments data, rather than customer-specific shipment data, are used. Therefore, some shipments data cannot help to explain customers' demand for electricity when customers' shipments are very different from a constant fraction of industry shipments.

#### 4.2 TOU Elasticities

The demand for a product may vary when its own price changes, or the price of its substitute changes, or both. Elasticities are the measures of the responsiveness to such prices and therefore measures of a firm's flexibility for changing consumption patterns. Discussion below will include speculations based on the estimated elasticities.

#### 4.2.1 Elasticity of Substitution

The (Morishima) elasticity of substitution measures a change of relative demand for two electricity commodities with respect to a change of their relative price. The long run elasticity here is implied by the model structure. The converging of short to long run elasticities of substitution shows that customers probably adjust their electricity consumption pattern gradually with respect to a change of relative price (see Table 7). Nevertheless, most of the adjustment occurs within six months.

Industry elasticities in Table 7 are weighted average elasticities where customers' elasticities are weighted according to their energy consumption and Leontief customers are assigned zero elasticities.

Shifting from the Mining, Paper and Allied, Non-Metallic Mineral and Chemical and Chemical Products industries may be little since their elasticities of substitution are very small. Some shifting can be expected from the Mining and Primary Textile industries according to their elasticities of substitution. With high elasticities of substitution, strong shifting may occur for those direct customers in the Rubber and Fabricated Metal Products industries.

#### 4.2.2 Own-Price Elasticity

The (Allen) own-price elasticity measures a change in electricity demand due to a change in its own-price. Again, the converging of short to long run elasticity demonstrates that customers adjust their electricity consumption pattern gradually with respect to a change in electricity price (see Table 8). Industry elasticities are weighted average elasticities and Leontief customers are assigned zero elasticities.

Labour costs usually represent one of the largest input costs of production, and energy savings incurred from shifting may not be enough to offset the increase in labour cost, not to mention other potential labour issues which may arise. Therefore, peak elasticities, the smallest among the three groups of electricity commodity, confirm that customers are inflexible in shifting demand away from the peak period. On the other hand, relatively larger elasticities for demand charges show a lot of reaction to the deemphasis of demand charge under the TOU rate structure.

The small own-price elasticities for peak and off-peak energy in the Mining, Primary Textile, Paper and Allied, Non-Metallic Mineral, Refined Petroleum & Coal, and Chemical & Chemical Products Industries suggest that little shifting could be expected from these industries. However, direct customers with large own-price elasticities in the Rubber and Fabricated Metal Products industries may exhibit some shiftings.

#### 4.3 SIMULATING THE 1991 TIME-OF-USE IMPACTS

In order to measure the TOU impacts on load, we need to know what customers would demand if they were faced with a Non-TOU price but with the same economic, seasonal and technological environment. This was accomplished by simulating the Non-TOU load, assuming the coefficients and elasticities from the estimated models, a Non-TOU price but assuming the actual economic, seasonal and technological In addition to finding the TOU impacts, Monte Carlo simulation procedures allowed us to calculate the statistical significance of such impacts. For example, confidence bands are generated for the Non-TOU Peak demand to test the statistical significance of the TOU impact on Peak demand. We conclude that significant TOU impact occurred only if a customer's TOU (actual) Peak demand is below the confidence band of the Non-TOU peak demand (See Figure 1 and Figures in Appendix B). Here, TOU impacts estimated are strictly due to the TOU rate reform since all other factors have been netted out already.

4.3.1 TOU impact on the 1-hr Load Factor

The 1-hr Load Factor (LF) is defined as follows:

1-hr LF = <u>Total Energy (Peak and Off-Peak)/Total Number of Hours</u> 1-hr Peak During the Peak Period

The 1-hr Load Factor measures customers' overall energy consumption relative to the 1-hr Peak Demand during the Peak period (Billing Peak Demand). It has implications for customers and local distribution systems which are sensitive to peak demand.

The deterioration of the 1-hr Load Factor among most of the direct customers illustrates a responsiveness to the drop in the relative demand charges (see Table 9). This may cause a potential threat to the local distribution system if this trend continues.

4.3.2 TOU impact on the 16-hr Load Factor

The 16-hr Load Factor is defined as follows:

16-hr LF = <u>Total Energy (Peak and Off-Peak)/Total Number of Hours</u>
Total Peak Energy/Total Number of Peak Hours

The 16-hr Load Factor measures customers' overall energy consumption relative to the peak energy consumption. It provides an indication of the split of energy consumption between the peak and off-peak periods.

Almost all of the direct customers reacted to the price differential between the peak and off-peak periods positively by increasing their 16-hr Load Factors, even though the overall impact was small (see Table 9).

#### 4.3.3 TOU impact on Peak and Off-Peak Energy Consumption

The simulated TOU impacts can be broken down into two types:

- The impact from the two-equation model (except Leontief customers which have no TOU impact from the two-equation model); i.e., the shifting between the peak and off-peak periods;
- The impact from the Aggregate Electricity Demand model (only if the relative energy price variables are found to be statistically significant); i.e., the overall reduction in energy consumption due to changes in relative energy prices.

However, the Aggregate Electricity Demand model cannot distinguish whether the TOU impact is a result of conservation or fuel switching activities. Overall, the reported TOU impacts can come from the two-equation model, the Aggregate Electricity Demand model, or both.

The 22 Leontief customers, who responded to changes in relative energy prices alone, contributed about a 10.7 mw December peak reduction due to TOU (this represents about 27% of the total December TOU impact). There were also 7 other customers whose TOU impacts were from the two-equation model as well as the Aggregate Electricity Demand model. Therefore, both sources of the TOU impacts are important.

When there is a price differential between any two periods, a shifting in load from a higher priced period to a lower priced period is usually expected. In other words, there will be a reduction in load in a higher priced period with an increase in load in a lower priced period. There are two types of shifting: inseason shifting and seasonal shifting. An inseason shifting refers to a shifting within a season (eg. summer) while a seasonal shifting is a shifting in total energy consumption from one season to another (eg. winter to summer). An unbalanced shifting happens when an energy reduction in one period is not equal to an energy increase in the other period. All customers had unbalanced shifting.

Reductions in average monthly peak energy consumption were found in almost all direct customers during the winter (see Table 10). The exceptions were the direct customers from the Refined Petroleum & Coal and Food industries. It was not a surprise because these customers did not respond to either price differentials under the TOU rate structure (i.e. Leontief models) or changes in relative energy prices (i.e. Aggregate Electricity Demand models).

Examples for in-season shifting were the Primary Textile, Paper & Allied, and Chemical & Chemical Products industries. Since the Mining and Non-Metallic Mineral industries reduced peak, off-peak and total consumption during the winter period, this reflected customers' positive response to the winter peak price increase and established the ground for a seasonal shifting.

During the summer, although industries such as the Primary Textile, Paper & Allied, and Chemical & Chemical Products industries continued to have in-season shifting, the Mining and Non-Metallic Mineral industries increased both their peak and off-peak energy consumption. As mentioned earlier, the Mining and Non-Metallic

Mineral industries responded to the seasonal price differential of the TOU rate by having seasonal shifting.

Direct customers in other industries were also divided into inseason and seasonal shifters. As a whole, direct customers reduced both peak and off-peak energy consumption during winter and achieved an in-season shifting during summer. As a result, the average monthly winter total energy consumption was reduced by 15,130 mwh (or 0.99%) while the average monthly summer total energy consumption was increased by 12,951 mwh (or 0.87%). This translated to an annual average monthly reduction of 1,089 mwh (or 0.07%).

The increase (decrease) in total energy consumption for a customer may imply that its total electricity bill has decreased (increased) relative to a Non-TOU price system. As a result, there would be a positive (negative) income effect if electricity prices are dropping (rising) relative to customers' industry prices and natural gas price. For individual direct customers, the changes in total energy consumption are mixed.

#### 4.3.4 TOU impact on the 1992 December 16-hour Peak

Since Ontario Hydro's "official" 16-hour peak usually happens in December, it is essential to know the TOU impact on the December 16-hour Peak. There are two types of TOU impact: cumulative and net.

#### 4.3.4.1 <u>Cumulative TOU Impact</u>

The cumulative TOU impact is defined as the total change in peak demand due to the TOU rate since the beginning of implementation. The cumulative TOU impact in each year is estimated using all the information available upto that year. As Table 11 indicates, the 1991 and 1992 cumulative TOU impacts were 45.82 mw and 39.35 mw peak reduction respectively. They corresponded to 2.41% and 2.06% reduction of the total December Peak demand from all direct customers.

At the industry level, the largest MW reduction contributor was the Mining industry with a -18.88 mw cumulative shifting. It was followed by the Paper & Allied industry with a -7.09 mw cumulative shifting. However, these reductions represented less than 4% of the total Peak demand in their industries.

On a customer basis, direct customers in the Rubber and Wood industries achieved some big percentage reductions (-32% and -27% respectively) in peak. Direct customers in the Primary Metal and the Transportation Equipment industries also reduced peak by more than 2 mw each.

#### 4.3.4.2 Net TOU Impact

The net TOU impact can be defined as the difference between the estimated cumulative TOU impacts of two consecutive years. However, the net TOU impact can also be defined as the sum of incremental shiftings and reversals. Incremental shiftings refer to increases in shiftings while reversals imply reductions in shiftings. On an individual customer basis, only one of these activities will occur. At the industry level, both events can take place. A negative net impact means an incremental shifting while a positive net impact implies a reduction in shifting.

The 1992 net TOU impact was 6.47 mw. It was the difference between 1992 and 1991 cumulative impacts (i.e., 6.47 mw = -45.82 mw - (-39.35 mw)). It was also the sum of the total shiftings (-20.96 mw) and the total reversals (27.43 mw).

#### 4.3.4.2.1 1992 Incremental Shiftings

The highest incremental (9.26 mw) came from the Mining industry. It looked like the drop in shipments (a proxy for production) for some direct customers in this industry allowed them to convince workers to shift production to the off-peak period. The second largest (4.20 mw) incremental shifting came from the Paper & Allied industry.

#### 4.3.4.2.2 1992 Reversals

Although shiftings appeared in the Mining and Paper & Allied industries, they also had reversals. Furthermore, the reversal in the Paper & Allied industry was the largest (15.04 mw). With the increase in shipments, some direct customers in this industry might find that the flexibility to shift was reduced and production during the peak period became necessary. Similar situations might apply to the Non-Metallic Mineral and Chemical & Chemical Products industries where large reversals (over 2 mw) occurred.

#### 4.3.4.2.3 1992 Net TOU Impacts

At the industry level, only the Mining industry came out with a -7.77 mw net TOU impact. The incremental shiftings in the Paper & Allied, Non-Metallic Mineral and Chemical & Chemical Products industries were all surpassed by their reversals such that their cumulative impacts had been reduced. So when the second largest incremental shifting paired with the largest reversal, the outcome was that the Paper & Allied industry had the largest positive net TOU impact of 10.84 mw.

For the remaining direct customers from other industries, the net TOU impacts were mixed and small. As a whole, the direct customers ended up with a 6.47 mw net TOU impact for 1992 (or a 6.47 mw reduction in cumulative shifting).

#### 5.0 Concluding Remarks

The report provides an up-date of the econometric analysis of large direct customers' responses to the Time-of-Use rate structures. The methodology provides an estimate of the net impact while controlling for economic activity.

Given the state of the economy in 1992, Time-Of-Use rates contributed to a reduction of 39.35 MW on the December peak - a 2.06% reduction. In the winter, there was a 13,1240 Mwh (1.89%) average monthly reduction in the peak period and an overall average monthly reduction of 15,130 Mwh (0.99%). In the summer, there was an average monthly reduction of 7,585 Mwh (1.10%) in the peak but an overall average monthly increase of 12,951 Mwh (0.87%). Over the whole year, there was an average monthly reduction of 10,351 Mwh (1.49%) in the peak period and an average monthly increase of 9,368 Mwh (1.15%) in the off-peak period. All these gave an annual average monthly reduction of 1,089 mwh (0.07%) for the year.

At the industry level, the Mining industry was the biggest contributor to the cumulative and net mw reduction (-18.88 mw and -7.77 mw respectively). On the other hand, although the Paper & Allied industry was the second largest contributor to the cumulative mw reduction (-4.20 mw), it also suffered from the largest loss of cumulative shifting (-10.84 mw).

Direct customers in the other industries appeared to respond well to the TOU rate in 1992 by increasing their cumulative shifting. Exceptions were the Primary Metal and Fabricated Metal Products industries which lost some of their cumulative shifting.

The measurement of the overall conservation effect (through the aggregate demand equation) needs refining. Further analysis could be undertaken using pooled or cross-sectional analysis at the industry or firm level.

The estimated elasticities are drawn from a period (1985-1992) where there was at most one business cycle. To help refine some of the elasticity estimates, it may be worthwhile to draw upon some of the historical data for the firms with data back to 1981 which include the last recession. (This data is available for about fifty firms.)

In this paper, we quantified the impacts, given the economy in 1992. There are two opposite arguments about customers ability to shift during recession years. One argument suggests that more load shifting has happened as customers became more cost conscious and unions have been more cooperative. The converse argument is that customers production has been reduced so much that customers load shifting has been cut down or at best maintained at the same level. The models can be used to simulate the impact of TOU rates under different economic scenarios.

The direct customers' Time-Of-Use price differentials continue to change until 1992 - at which time they are frozen for 10 years. The analysis of TOU impacts in 1992 and thereafter will help us answer whether the methodology and results are stabilizing. Certainly, the issue of short run versus long run impacts will be better addressed.

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #57 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 41/ Section 3.2.5 9 10 The Consultant states, "The Cheng and Mountain results are the best available empirical 11 estimates of substitution elasticities in Ontario". 12 13 Please provide the criteria by which the results obtained in this study are judged to be the 14 best estimates available. 15 16 17 **Response** 18 19 This response is provided by Power Advisory. 20 21 This study applied appropriate econometric techniques to individual customer billing data 22 to produce estimates of elasticities of substitution. No other study could have access to 23 the same data, since this one was done within Ontario Hydro. An extensive search, a 24 review of an extensive bibliography of electricity elasticity studies, and discussions with 25 several elasticity experts did not disclose any studies with better estimates of elasticities 26 of substitution for Ontario industries. 27

5	
6	8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the
7	status quo charge determinants for Network service?
8 9 10	Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 41/ Section 3.2.5
11	The report says, "They may therefore overstate the current customers' reaction to
12	changes in prices because there is less scope for shifting that at the time of their
13	estimation."
14	
15	Please provide analysis, including assumptions, data sets and calculations, to substantiate
16	the statement that "there is less scope" for shifting now than in 1993.
17	
18 19 20	Response
21	This response is provided by Power Advisory.
22 23	There is less scope for shifting given the availability of demand response programs as
24	well as the use of real time pricing where electricity supply costs to customers change
25	from hour to hour. This is evident from the hourly demand data presented by AMPCO
26 27	which shows significant loading shifting from peak to off-peak periods. (Pre-filed evidence submitted by AMPCO in EB-2008-0272, p. 5)

5	
6	8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the
7	status quo charge determinants for Network service?
8	
9	Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 41/ Section 3.2.5/Table 10
10	
11	In Table 1, the Consultant applies an elasticity of 0.02 in the high case.
12	
13	Please explain the rationale to apply an elasticity for industries for which no statistical
14	evidence of elasticity was found.
15	
16	
17	<u>Response</u>
18	
19	This response is provided by Power Advisory.
20	
21	The evidence found was not sufficient to reject the null hypothesis that the elasticity is
22	zero. As part of a case where all elasticities are higher than the available estimates,
23	Power Advisory applied a small elasticity to this industry.
24

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #61 1 2 List 1 3 **Interrogatory** 4 5 8.1 Is it appropriate to implement "AMPCO's High 5 Proposal" in place of the 6 status quo charge determinants for Network service? 7 8 Ref: Ex H1/Tab 3/Schedule 1/Attachment 1/Page 50/ Section 3.3/Footnote 121 9 10 Please provide the details of the finding that explains the Consultant's conclusion that 11 AMPCO appears to have misapplied the elasticity formula. 12 13 Response 14 15 This response is provided by Power Advisory. 16 17 Correct definition and application of own-price elasticity 18 19 Own-price elasticity is given here by the symbol $\eta$ : 20 21 $\eta = dq/dp \times p/q$ , where p and q are the original price and quantity and dq/dp is the first derivative of the demand curve at the point where elasticity is being evaluated. 23 24 In finite terms, as a % formula, it is 25 $\eta = \Delta q/q \div \Delta p/p.^{1}$ 26 27 Therefore, by simple rearrangement, we get 28 $\Delta q = \eta \times \Delta p/p \times q$ . 29 30 AMPCO application in Undertaking J6.3 (EB-2008-0272) 31 32 The clearest statement by AMPCO of the formulas it used is in Undertaking J6.3. Using 33 the formulas in Undertaking J6.3, the AMPCO formula for $\Delta q$ is 34 35 $\Delta q = (\eta \times (p + \Delta p)/p \times q \times q/p)/100.$ 36 37

<sup>&</sup>lt;sup>1</sup>This can be read as the % change in quantity/ % change in price. See, for example, EPRI, Price Elasticity of Demand for Electricity: A Primer and Synthesis, Jan/. 2008, pg. 16.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 61 Page 2 of 2

This formula has  $(p+\Delta p)/p$  instead of  $\Delta p/p$ , an extra term of q/p, and an extra division by

2 100.

3		<u>=====</u>
4	<u>Interrogatory</u>	
<ul><li>5</li><li>6</li><li>7</li></ul>		priate to implement "AMPCO's High 5 Proposal" in place of the charge determinants for Network service?
8 9 10	Ref: Ex H1/Tab 3	/Schedule 1/Attachment 1/Page 58/ Section 5/Footnote 131
11	A) Please expl	ain whether, in the Consultant's opinion, the "commodity cost"
12 13	includes the	e Global Adjustment.
14	B) Please expl	ain why the Consultant did not calculate the effect on the Global
15	Adjustmen	of a reduction in HOEP.
16		
17 18 19	<u>Response</u>	
20 21	The response to pa	rts A and B are provided by Power Advisory.
22 23 24	A) The commodit Global Adjustr	y cost is meant to refer to the HOEP and thus doesn't include the nent.
24 25 26 27 28	However, Pow offset a signific	and the scope of the analysis requested by Hydro One in its RFP. The Advisory expects that the increases in the Global Adjustment would cant proportion of the commodity cost savings realized by consumers. While implementation of the High 5 proposal may cause HOEP to
29 30	decrease, Powe	r Advisory believes that a significant portion of this decrease would be sees in the Global Adjustment.

December 29, 2009

The Honourable Gerry Phillips Minister of Energy and Infrastructure 4<sup>th</sup> Floor, Hearst Block 900 Bay Street Toronto, Ontario M7A 2E1

Dear Minister:

### Status Report – Transmission and Distribution Projects in Support of Renewable Energy Projects

On September 21, 2009, the former Minister of Energy and Infrastructure and Deputy Premier, George Smitherman, wrote to our Chair, James Arnett, asking Hydro One to immediately proceed with the planning, development, and implementation of transmission projects and distribution system upgrades in anticipation of the Feed-in Tariff program and the associated high demand for renewable connections. We subsequently confirmed our understanding of the letter's intent and concurred with what was asked by the Minister.

We have developed a Green Energy Implementation Plan, which provides a comprehensive framework for accomplishing the Transmission and Distribution projects outlined in the September 21<sup>st</sup> letter. The Plan includes an assessment of the necessary actions and processes associated with obtaining approvals for the transmission projects. This Plan was shared with Ministry staff in November and will continue to be updated to reflect the status of the renewable energy projects.

Eight priority transmission projects in northern and southwestern Ontario have been identified, in consultation with the OPA. The development work for seven of these projects is well underway and work on others will be initiated early in 2010. Our progress on these projects is a reflection of our expertise and commitment to the timely expansion of Hydro One's transmission and distribution networks to accommodate renewable generation.

The remaining suite of projects will be initiated once the results of the Feed-in Tariff program and the need for new transmission are confirmed by the OPA. It is important that we continuously review and re-align our plans to be consistent with the location of renewable generation applications throughout the Province.

The development work to obtain approvals involves a number of inter-related processes which most often require three years and beyond to complete. Our recent experience with major transmission projects has provided us with an extensive understanding of these existing processes and has positioned us well to undertake the projects outlined in the Minister's letter.

Our experience also shows that extensive coordination and timely actions are required from not only Hydro One but the OPA, IESO, and government ministries including the MEI, MOE and MNR, to support the need for these projects and to meet our ambitious project timelines. Furthermore, regulatory clarity is important in understanding how the OEB will test the prudence of the green transmission and distribution projects in light of its new statutory object to "promote the use and generation of electricity from renewable energy sources in a manner consistent with the policies of the Government of Ontario, which includes the timely expansion or reinforcement of transmission systems and distribution systems to accommodate the connection of renewable generation facilities". In this regard, we are working closely with all affected agencies, ministries and our regulator.

Hydro One fully understands the importance to the Province of Ontario of the *Green Energy and Green Economy Act* and the Feed-in-Tariff (FIT) Program. The projects have been given a high priority within our business plan and are fully supported at an internal working level. The unprecedented response to the FIT Program will require some re-alignment of our plans in order to ensure we are giving the right priority to our transmission and distribution projects. We are also continuing to examine and discuss potential partnership models, including partnerships with First Nation communities.

We will continue to provide regular briefings to Ministry staff. Should you require further details at any time on the activities and progress associated with the green projects, please contact me or Mike Penstone, Vice President of Major Project Coordination and External Relations at (416) 345-5444.

Sincerely,

Laura Formusa

President and CEO

### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #72 List 1

2 3 4

1

#### **Interrogatory**

5

## 9.1 – Are the OM&A and capital amounts in the Green Energy Plan appropriate and based on appropriate planning criteria?

8

7

#### Ref: Ex A/Tab 11/Schedule 4/Page 2

10 11

The evidence states on page 2 that the GE Projects are required to connect new renewable generation facilities procured through the FIT program and "other means".

13

12

A) Please provide a definition of "other means".

14 15 16

B) What is the historical and forecasted capacity (test years and beyond) for renewable generation contracted through "other means"? How has Hydro One incorporated this capacity in its Green Energy Plan?

18 19

17

#### **Response**

202122

A) "Other means" is the collection of procurement processes other than the FIT Program that contract for the development of renewable generation resources. For example, this includes the OPA's RESOP, CHP III, RES, HESA, and other programs.

242526

23

B) The historical results of the OPA's non-FIT procurement programs for renewable generation resources are provided in the table below.

27 28

Resource Type	Capacity under Contract as of Q1 2010 (MW)						
Bioenergy	91						
Bioenergy CHP	78						
Hydro	1,190						
Solar	526						
Wind	1,888						
Total	3,773						

29 30

Source: OPA's "A Progress Report on Electricity Supply First Quarter 2010"

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 72 Page 2 of 2

These resources are not part of the green energy plan as they were evaluated by Hydro One through the CIA process.

3

5

Hydro One is not aware of any forecasts other than the Green Energy Investment Agreement, under a directive to the OPA from the Minister on April 1, 2010 for the development of 2,500 MW of wind and solar resources.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 73 Page 1 of 1

#### Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #73 1 2 List 1 3 **Interrogatory** 4 5 9.1 – Are the OM&A and capital amounts in the Green Energy Plan appropriate 6 and based on appropriate planning criteria? 7 8 Ref: Ex A/Tab 11/Schedule 4/Page 2 9 10 The evidence states, "While the timing and nature of some GE projects will depend on 11 the results of the FIT program, this Plan encompasses transmission investments that will 12 form the backbone of an electricity system re-designed to integrate up to 10,000 MW and 13 beyond of potential renewable generation". 14 15 A) For the GE projects referenced above that depend on the results of the FIT 16 program, please provide the latest FIT program results related to these projects. 17 18 B) What impacts do the current results have on these projects with respect to timing, 19 spending and prioritization? What are the forecasted FIT program results related 20 to these projects? 21 22 C) Please explain how the estimated 10,000 MW and beyond of potential renewable 23 generation was derived. 24 25 **Response** 26 27 A) Please see Exhibit I, Tab 1, Schedule 101. 28 B) The OPA's Economic Connection Test process will assign FIT applicants to specific 29 transmission projects. As this process is not yet underway, it is not possible to 30

forecast FIT program results related to the GE projects at this time.

C) The estimate was based on FIT results published on the OPA website.

1 2

The OM&A development work in the test years was only planned for the projects in the

- first category and these costs are shown in Table 5 on page 46 of the exhibit, however as
- explained in Exhibit I, Tab 1, Schedule 98 this work is now on hold. Capital costs are
- only planned for two of the projects in the test years as shown in Table 4 on page 37.

6	9.2 – Are Hydro One's accelerated cost recovery proposals for the Bruce-to-Milton
7	line and for Green Energy projects appropriate?
8	
9	Ref: Ex A/Tab11/Schedule 5/Page 8/Table 2
10	
11	Please provide a pro forma version of this Table that compares the customer's impact of
12	requirement for revenue from Hydro One's proposed Construction Work In Progress
13	(CWIP) treatment with a treatment whereby the Board would allow Hydro One to
14	expense interest costs throughout the project life.
15	
16	
17	<u>Response</u>
18	
19	Hydro One assumes that "project life" means "construction period" or "pre-inservice
20	period" and that interest costs would be recovered over that period, at the AFUDC rate, rather than recovered using the all-in return as is proposed under the CWIP in ratebase
21 22	proposal.
23	proposal.
24	Please see Exhibit I, Tab 4, Schedule 74, part a) for the revenue requirement impact in
25	the test years 2011 and 2012 from using the AFUDC rate instead of the weighted average
26	cost of capital.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 84 Page 1 of 1

Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #84
<u>List 1</u>
<u>Interrogatory</u>
9.2 – Are Hydro One's accelerated cost recovery proposals for the Bruce-to-Milton
line and for Green Energy projects appropriate?
Ref: Ex A/Tab11/Schedule 5/Page 1
The evidence indicates that 100% of annual CWIP expenditures for the 500 kV Bruce to
Milton Double Circuit Line project are to be treated as if they were added to rate base
until the project is placed in service.
Did Hydro One consider the option of applying CWIP into rate base on a staged basis as
construction proceeds? If no, please explain.
Response
<u>Response</u>
Hydro One interprets "staging" to mean that construction costs would be added to
ratebase on a month-by-month basis prior to in-service, or at least more frequently than
once per year at year-end as the company is proposing to do.
The company did not consider a more frequent interval of ratebasing for CWIP in ratebase purposes as the annual approach coincides with the OEB's usual practice for rate
making purposes, wherein ratebase is calculated on a mid-year basis.

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 85 Page 1 of 2

1 2	<u>Association of Major Power Consumers of Ontario (AMPCO) INTERROGATORY #85</u> <u>List 1</u>
3	<u>Interrogatory</u>
5	
6	9.2 – Are Hydro One's accelerated cost recovery proposals for the Bruce-to-Milton
7	line and for Green Energy projects appropriate?
8	
9	Ref: Ex A/Tab 11/Schedule 5/Page 10/Section 6
10	
11	Table 3 on page 10 lists two projects proposed for Accelerated Cost Recovery of CWIP
12	for annual expenditures in their individual Section 92 applications:
13	
14	- Northwest Transmission Reinforcement; and
15	- Algoma x Sudbury Transmission Expansion.
16	
17	A) Please identify the specific investment risks associated with each of the above
18	projects.
19	
20	B) Please explain why Hydro One does not feel conventional mechanisms are
21	adequate in connection with the above proposed investments to address
22	investment risk.
23	
24	C) Please indicate the cost of each project in proportion to current rate base.
25	
26 27 28	<u>Response</u>
29 30 31	A) These are both very large and complex projects. The Northwest project is a Greenfield project which will increase the project risks even further. The following excerpt from Exhibit A, Tab 11, Schedule 4, page 35 explains the risks.
32 33 34	"In addition to the large cost of the Plan, the green projects also have a high degree of risk associated with them. This also supports the need for an alternative funding

Filed: August 16, 2010 EB-2010-0002 Exhibit I Tab 9 Schedule 85 Page 2 of 2

mechanism. Building such large, complex and multi year projects will present very significant challenges:

- 1) In almost all cases involving new line construction there will be the need for consultation with First Nations & Metis communities and a number of issues to be resolved around access to the land, financial settlements and compensation and creation of jobs for the communities.
- 2) There will be major property acquisition issues. In the case of larger projects there will be hundreds of landowners to negotiate with. Most landowners will want to maximize the value of their land. This has been demonstrated in the Bruce to Milton project where even after a very protracted negotiation period expropriation of many properties is required.
- 3) There will be environmental risks with all of the projects. Most of the projects will require Environmental Assessments and there are numerous issues associated with potential contamination and land remediation, preservation of water bodies and wet lands, protection of cultural and heritage sites and protection of endangered species.
- 4) There will be timing risks with all the green projects but especially the longer term construction projects. Projects that are initiated under the current policy objectives of the government may be subject to delay, changes or even cancellation if the policy objectives change in future years.

Bruce to Milton and other recent line construction projects have been able to utilize existing or widened corridors and yet the issues encountered as noted above have been substantial. A number of the Green Energy projects will involve true Greenfield projects. The property acquisition and Environmental risks will be significantly multiplied for Greenfield projects. It is expected that Environmental Assessments for Greenfield projects will be more complicated and will take at least two years to complete."

- B) Please see Exhibit I, Tab 1, Schedule 122 to explain the reasons why accelerated cost recovery of CWIP is recommended for these projects.
- C) The Board approved Rate Base for 2010 is \$7,635.9M. The forecast cost of Northwest Transmission Reinforcement represents 5% of rate base and the forecast cost of Algoma x Sudbury Transmission Expansion represents 6% of rate base.
