

The province/nationwide mantra for the last several years has been 'conserve energy'. My husband and I are seniors. We have complied with the 'conserve energy' request along with countless other conscientious citizens. Our local Enwin Utility now says that their revenue is down and are seeking a rate increase of \$100.00 perhousehold! What has the utility done to contain costs in the face of falling revenue due in large part to a successful conservation campaign? Windsor/Essex County has huge wind and solar farms. Who benefits from that energy generation? This rate increase should not be allowed until it is shown that the utility has done its due diligence - find and implement efficiencies within the company.
