

# Retail Council of Canada (RCC)

## Renewed Regulatory Framework for Electricity

---

**OEB Stakeholder Conference**

March 28, 2012

Travis Allan (Zizzo Allan)

Francisca Quinn (Loop initiatives)

# Retail Council of Canada (RCC)

- The voice of retail across Canada
- RCC members: 80% of retail sales nationally
- Large chains and small independents
- Retail employs 805,600 Ontarians (the province's 2<sup>nd</sup> largest employer)

## Retail Sector Electricity Insights

Retail Council of Canada  
March 20, 2012

## Contents

- Research methodology
- Electricity use in retail and cost implications
- Electricity management

## Research methodology

## Data on electricity use in the retail industry is lacking

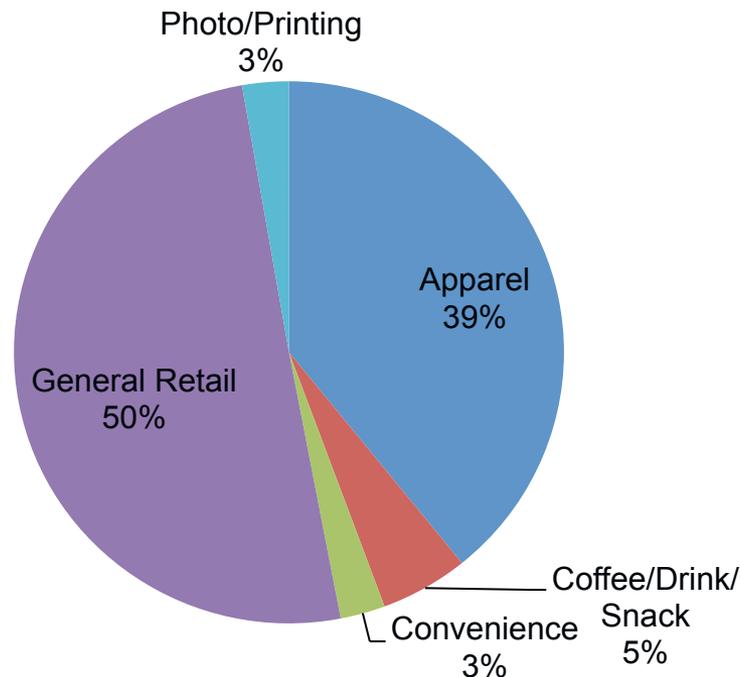

- Literature review revealed no information beyond high-level energy use profiles and typical conservation measures
- Published information does not apply to current Canada/Ontario scenario
- Retailers treat electricity use and cost as confidential information due to industry competitiveness and investment in acquiring expertise
- New information required to inform RCC consultation response

## Industry associations and government sources were reviewed (limited use)

Type of Association	Reviewed Association Websites
Government	<ul style="list-style-type: none"> <li>ENERGY STAR U.S. and Canada</li> <li>Natural Resources Canada (NRCan)</li> <li>U.S Department of Energy –               <ul style="list-style-type: none"> <li>U.S Energy Information Administration (EIA)</li> <li>Retail Energy Alliance</li> </ul> </li> </ul>
Industry	<ul style="list-style-type: none"> <li>International Council of Shopping Centers (ICSC)</li> <li>Food Marketing Institute (FMI)</li> <li>Professional Retail Store Maintenance Association (PRSM)</li> <li>Edison Electric Institute (EEI)</li> <li>International Facility Management (IFMA)</li> <li>American Council for an Energy-Efficient Economy (ACEEE)</li> <li>Independent Electricity System Operator (IESO)</li> </ul>
Not for Profit	<ul style="list-style-type: none"> <li>Alliance to Save Energy, U.S.</li> <li>Carbon Trust, U.K.</li> <li>Greening Retail, Canada</li> </ul>

# We analysed 12 months of sub-metered TOU data from 34 small retailers to determine use profiles

## Retail Electricity Data Analysis (Retail Category by Share of Total Building Area)

## We also interviewed 6 large and 2 small retailers with Ontario presence

### Telephone Interview Participants

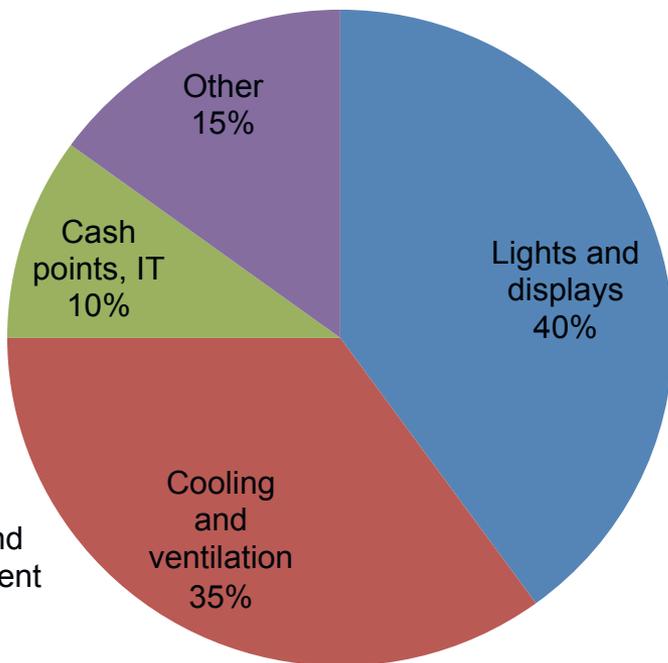

Size	Type of Retailer	Role
Large	Grocer	Director Risk Management
	Grocer	Lead Energy Management
	Big Box Furniture	Country Facilities Manager
	Department Store	Senior Manager Energy
	Chain – Telecom & Media	Energy Manager
	Chain – Specialty Retailer	Manager Energy & Environmental Management
Small	Sporting Goods	General Manager
	Kitchenware Goods	Vice President

## Electricity use and cost implications

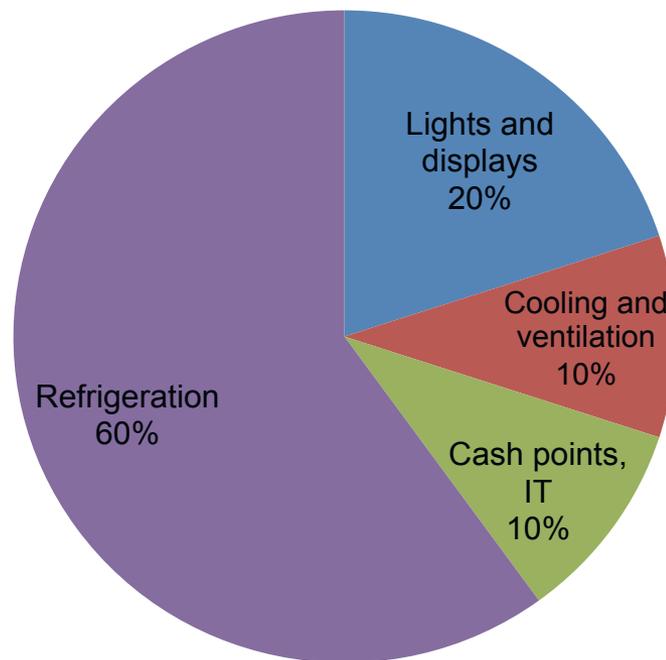

## Lighting and refrigeration consume most electricity in stores

**General Retailer**

Higher in summer and in department stores

**Grocer**

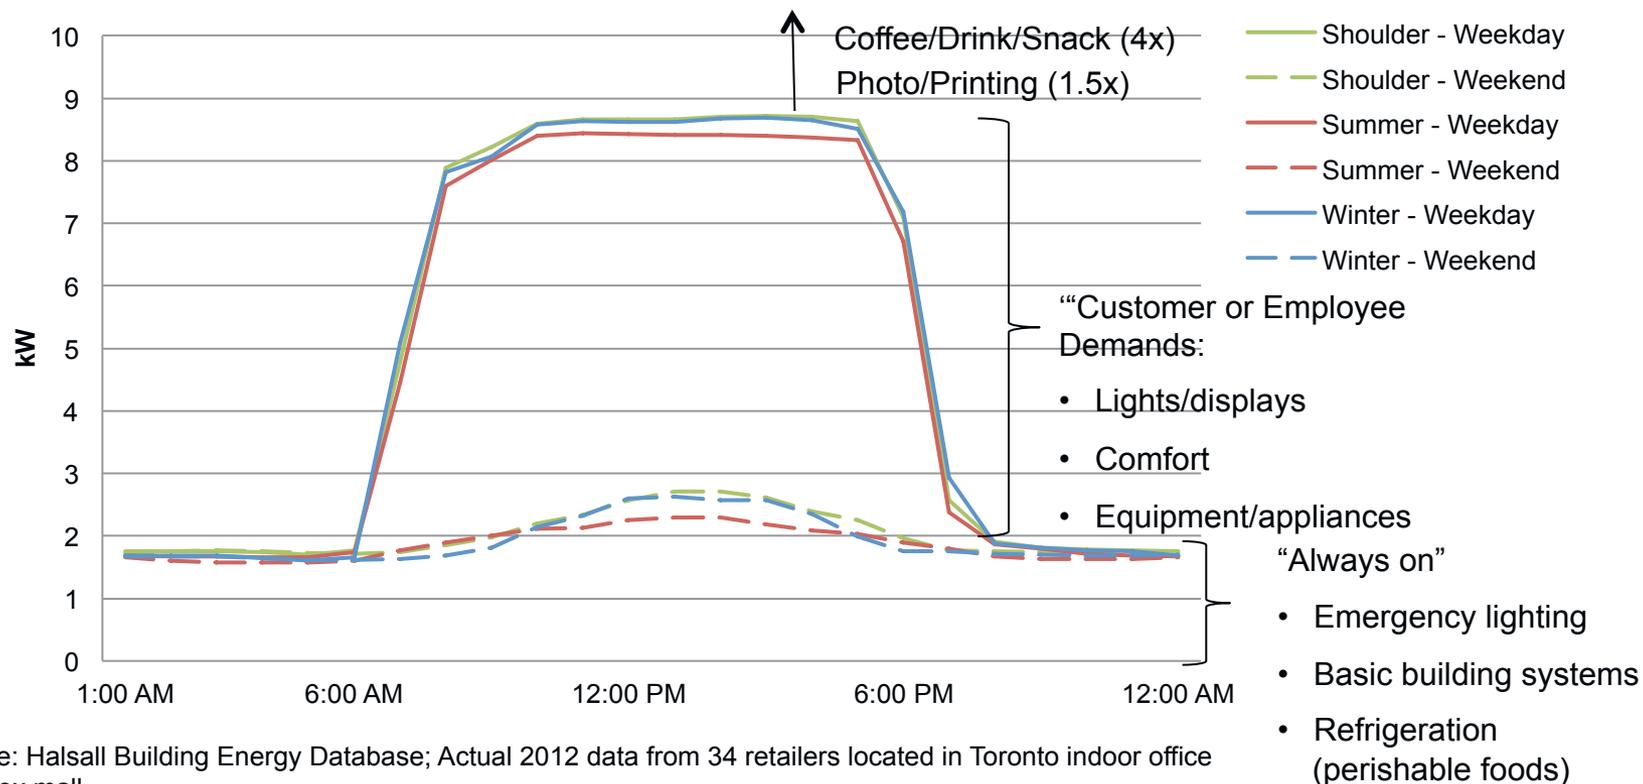

Higher in summer

Higher in summer

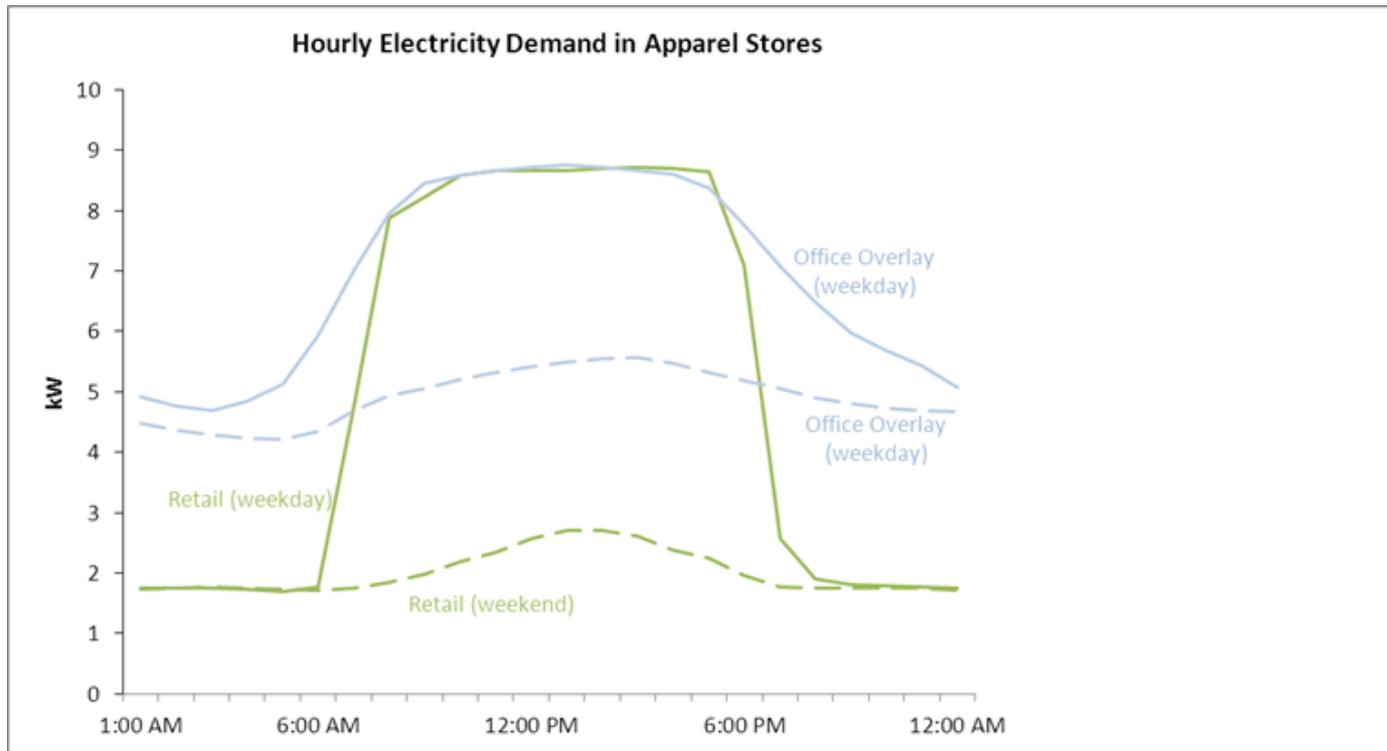

# Retail electricity consumption is a function of opening hours

## Average Daily Electricity Usage Apparel, Convenience and General Retail

# Retailers are relatively more exposed to TOU than consumers with a larger share of steady use

## Retail vs. Office Electricity Consumption Profile

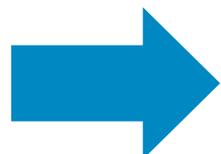

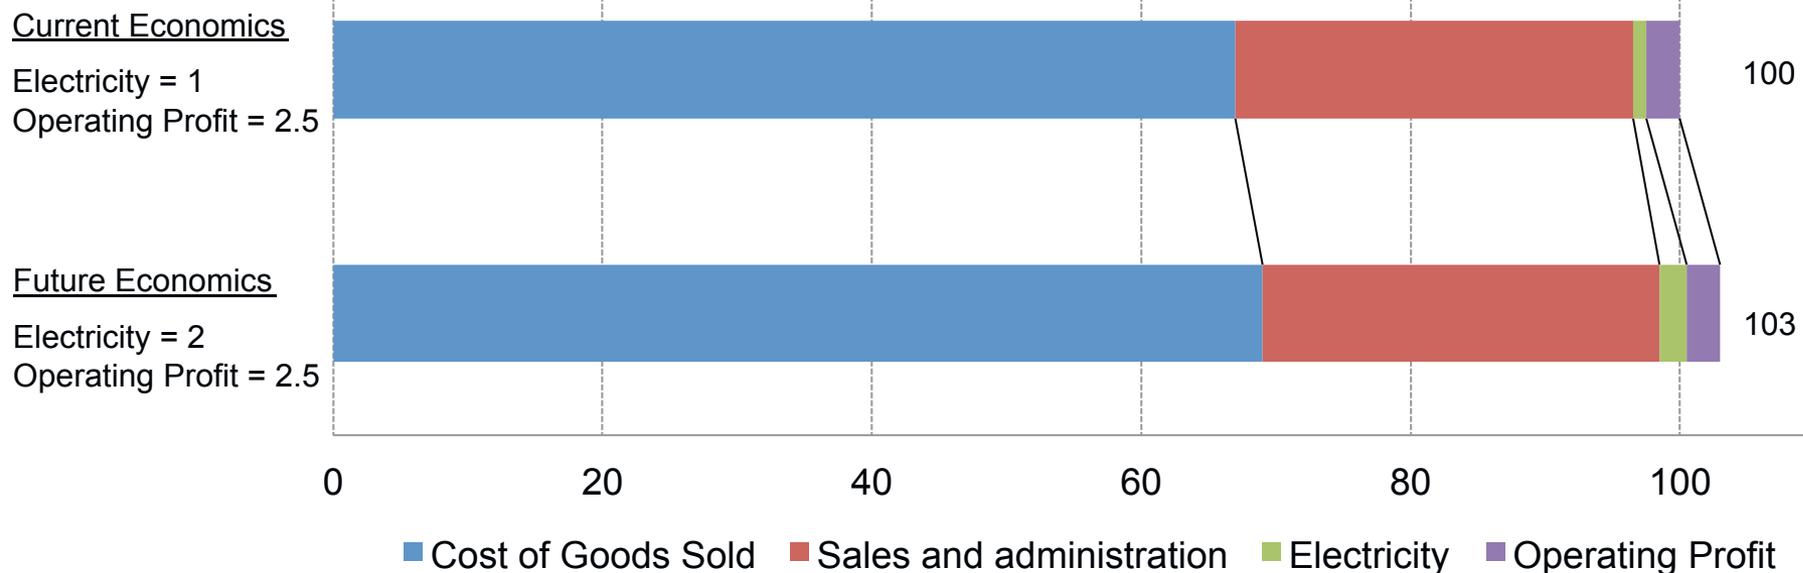

# Electricity can represent a significant cash cost for a small retailer

## Typical Daily Electricity Use for a 1,500 ft<sup>2</sup> Shop

Retail Category	Annual Electricity Use (kWh)	Estimated Annual Cost (\$)	Equivalent FTE Cost
Apparel	35,620	3,562	17%
Coffee/Drink/ Snack	171,596	17,160	83%
Convenience	41,182	4,118	20%
General Retail	34,518	3,452	17%
Photo/Printing	34,896	3,490	17%

# A doubling of electricity cost requires a 3% increase in sales to obtain same profit

## Illustrative Effect of 100% Increase in Electricity Cost

**Two Strategies to Mitigate Electricity Price Increase:  
Increase sales with 3% OR decrease fixed costs with 3%**

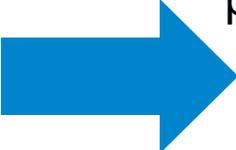

## Electricity Management

# For large retailers electricity management is a key competitiveness factor

## Observed Management Strategies at Large Retailers

- Execute bill audits: check invoices and compare metered consumption and applicable rates
- Implement utility management system: access to all consumption and cost data in one location and analytical tools
- Invest in energy efficiency where positive ROI
- Bulk supply (retail) contracts: lock in or hedge electricity costs
- Demand response: obtain advance warnings of black-outs and obtain compensation for shut down
- Own generation: avoid peak rates; sell electricity to distributors at premium rates

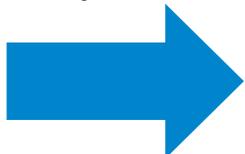

**Significant investments in know-how and technology are required to manage risk and opportunity**

# Due to lack of expertise, small retailers are more exposed to price increases

## Small Retail Disadvantages

- Electricity management is not a core competency - difficult to access, interpret and take action on electricity data – *“No one in the company would know % breakdown of electricity use”* [general manager, small retailer]
- Unaware of options to reduce electricity use *“We need lights and computers to run the business”* [vice president, small retailer]
- Not affordable to hire specialized staff or outsource to third party providers
- Often covered by TOU rates (where SMART meters have been installed)
- Typically unaware of changes to rates until after the fact - *“It just showed up on our bill”* [energy manager, chain of smaller outlets]
- Sense that they have no power - *“We have tried to get the data for more than two years and we are still trying”* [energy manager, chain of smaller outlets]

**Support programs needed to enable level playing field**

# Large retailer management experience shows potential, but execution barriers exist

## Common Strategies to Reduce Electricity Demand

Base Load	Peak Load	Total Demand
<ul style="list-style-type: none"> <li>• JIT scheduling of ventilation, cooling and lights</li> <li>• Equipment testing and maintenance</li> <li>• Fridge “curtains”</li> <li>• Minimum requirements for store cleaning and stocking</li> </ul>	<ul style="list-style-type: none"> <li>• Dimmed lights</li> <li>• Reduced cooling</li> <li>• Systems shut down</li> </ul>	<ul style="list-style-type: none"> <li>• Light retrofits (e.g. LED)</li> <li>• Upgrades of fridges, freezers and chillers</li> <li>• Switch to closed fridges and freezers</li> <li>• On-site renewable generation</li> </ul>

### Issues to Execute Strategies:

- Access to expertise
- Negative sales impact
- Significant capital requirements
- Available technology
- Customer mindset

# Large retailers do not feel they can control a large share of their cost, reducing incentives to take action

## Potential Components of Electricity Bills

Type of Charge	Observed Charges
Consumption Charge	<ul style="list-style-type: none"> <li>• Global adjustment</li> <li>• Wholesale operation charge</li> <li>• Special purpose fee</li> </ul>
Demand Charge	<ul style="list-style-type: none"> <li>• Distribution charge</li> <li>• Lost revenue adjustment</li> <li>• Transformer allowance</li> <li>• Shared savings charge</li> <li>• Transmission charge</li> </ul>
Fixed Charge	<ul style="list-style-type: none"> <li>• Local access fee</li> <li>• Customer charge</li> <li>• Basic charge</li> <li>• Electric energy charge</li> <li>• Administration charge</li> <li>• Delivery charge</li> </ul>

# Present contract structures disincentivize retailers to manage electricity

## High-level Overview of Contract Structures

Contract Structure	Applicable Retail	Subject to TOU	Ability to Influence		
			Consumption Charge	Demand Charge	Fixed Charge
Retail contracts with wholesalers	Large chains; Very large stores		✓	✓	
TOU pricing with local retail distributor	Small stores; Street location (non-mall)	✓	✓		
Billed directly by local retail distributor	Small stores; Street location (non-mall)		✓	✓	
Billed via landlord based on fixed/leased area rate	Shared building; Shopping centre location	<b>LACK OF INCENTIVE TO TAKE ACTION</b>			
Billed via landlord based on sub-meter	Shopping centre location	✓	✓		

**LACK OF INCENTIVE TO TAKE ACTION**

# At present, retailers do not appear to be significantly concerned about black-outs

## System Reliability – Interview Synthesis

- Electricity system reliability is very important due to impact on sales, employee/customer safety and security/theft
- In interviews, retailers did not indicate that black-outs are a major concern at current service levels, especially when compared with large and/or unpredictable price increases
- Most supply disruption is managed by battery back-up power provided by landlord, rented or own generator capacity
- Large scale disruption is most critical as electronic transactions (e.g. Interac, Visa) are not feasible

# Battery power is typically used during periods of shorter black-outs; presence of generators varies

## Factors Driving Backup Capacity

	Electricity Draw	Code Requirement	Health & Safety	Insurance Requirement	Internal Decision
<b>Battery Power to Enable Max 6 hours of Critical Operations</b>	Emergency Lighting	✓	✓	✓	
	Security System	✓		✓	✓
	Point of Sale System				✓
<b>Generators to Enable Business Operations</b>	Refrigeration				✓
	Lights				✓
	Building System				✓

# Economic context: crucial

- Intense pressure on profit margins
  - Increased minimum wages
  - Competition
  - A struggling economy
- Factor cost increases matter: higher costs → lower employment

# Energy and business

- Energy: not just a fixed cost of doing business, it dramatically influences retail success

# Communication

- Better communication in the language of retailers
  - Accessibility of usage data
  - Explanation of programs
  - Two-way dialogue

# Reliability

- Spoilage, payment processing & security
- Priority is cost certainty and control

# Cost certainty and control

- Mitigation strategy
- Lumpiness
- Predictable prices
- Appropriate demand forecasts
- Balanced, effective incentives
- Improved planning

# Thank you
