ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #1

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide Enbridge's definitions of "residential" and "apartment" customers.

RESPONSE

Please see the following definitions.

Residential customers are dwellings including singles, semis, townhomes and individually metered apartment units (ensuites).

Apartment customers include multi-residential buildings, which are served by a single bulk meter.

Witnesses: F. Ahmad
M. Suarez

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #2

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2014 inclusive Enbridge's **incremental** number of residential, commercial, apartment and industrial customers in the GTA Project Influence Area.

RESPONSE

Table 1: Incremental Customer Additions by Sector
GTA Project Influence Area (2004-2014)

	Residential	Commercial	Apartment	Industrial	Total GTA
2004	19,743	1,279	47	19	21,088
2005	19,203	1,503	27	6	20,739
2006	16,429	1,963	43	7	18,442
2007	17,028	1,496	3	2	18,529
2008	13,764	1,403	22	0	15,189
2009	9,921	1,198	36	5	11,160
2010	11,468	1,177	75	0	12,720
2011	9,263	917	26	4	10,210
2012	10,792	1,020	28	7	11,847
2013F	12,102	1,156	74	1	13,333
2014F	11,669	1,199	69	3	12,940

The Company has not historically tracked information for sub-areas such as the GTA Project Influence Area. To present historical information for the Influence Area, customer numbers have been derived based on one or more data systems to determine the proportion of GTA Project Influence Area customers to the total customers within Areas 10, 20, and 30 of the Franchise (within which the GTA Influence Area resides).

Witnesses: F. Ahmad
M. Suarez

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #3

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive the actual/forecast average: a) peak hour (GJ/hour), b) peak day (GJ/day) and c) annual demands (GJ/year) of Enbridge's **incremental**: i) residential, ii) commercial, iii) apartment and iv) industrial customers in the GTA Project Influence Area. Please also provide the aggregate peak hour, peak day and annual demands of each of these customer classes and all of Enbridge's GTA Project Influence Area customers for each year from 2000 to 2025 inclusive.

RESPONSE

Peak load by sector is not measured on an hourly or daily basis. The Company does derive some of this data for network planning purposes as per I.A4.EGD.ED.12. The information provided below is the historical data used for network planning.

Table 1 (please refer to Attachment) provides a summary of the derived peak load in m^3/hr from 2006 to 2025. This table shows peak load by customer type in the GTA Project Influence Area for both incremental and total load added, as well as total load for all customers in the GTA Project Influence Area.

Table 2 (please refer to Attachment) provides all the same data as Table 1 but has converted the hourly data to daily.

Data has only been provided for 2006 onward as EGD implemented a new load gathering system. Prior to 2004, load gathering was completed on a legacy main frame system and the archived data is not readily accessible. From 2004 to 2006 there were numerous changes in customer classifications which make year to year comparisons

Witness: E. Naczynski

irrelevant due to changing base data. The load presented excludes unbundled customers.

The conversion from m^3 to GJ as found in the EGD rate handbook is 37.69 MJ/m^3.

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #4

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive Enbridge's actual/forecast total number of residential, commercial, apartment and industrial customers in the GTA Project Influence Area.

RESPONSE

Total Customers by Sector

	Apartment	Commercial	Industrial	Residential
2004	4,424	68,606	4,773	777,117
2005	4,471	69,885	4,792	796,860
2006	4,497	71,388	4,798	816,062
2007	4,540	73,351	4,805	832,492
2008	4,543	74,848	4,807	849,520
2009	4,564	76,250	4,807	863,284
2010	4,600	77,449	4,812	873,205
2011	4,675	78,626	4,812	884,673
2012	4,701	79,543	4,816	893,936
2013	4,729	80,563	4,823	904,728
2014	4,803	81,718	4,824	916,831
2015	4,872	82,918	4,827	928,500
2016	4,943	84,208	4,830	940,776
2017	5,014	85,535	4,833	953,383
2018	5,083	86,785	4,835	966,418
2019	5,152	88,037	4,837	979,565
2020	5,220	89,288	4,839	992,896
2021	5,287	90,549	4,841	1,006,431

The Company uses multiple data management systems for specific purposes. The Company has not historically tracked information for sub-areas such as the GTA Project Influence Area. To present historical information for the GTA Project Influence Area,

Witnesses: F. Ahmad
M. Suarez

customer numbers have been derived based on one or more data systems to determine the proportion of GTA Project Influence Area customers to the total customers within Areas 10, 20, and 30 in the franchise (within which the GTA Influence Area resides). Forecasts of customer growth for the GTA Influence Area are layered on derived historical numbers and are denoted in the shaded areas.

Witnesses: F. Ahmad
M. Suarez

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #5

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive the actual/forecast *total peak hour* demands (TJ/hour) and average peak hour demands (GJ/hour) of Enbridge's: a) residential; b) commercial; c) apartment; and d) industrial customers in the GTA Project Influence Area. Please also provide the total peak hour demands for all of these customers for each year from 2000 to 2025 inclusive. Please also provide a further breakdown of the commercial customers by subsets such as offices, retail, hospitals, schools, etc.

RESPONSE

Peak load by sector is not measured on an hourly or daily basis. The Company does derive some of this data for network planning purposes as per the response to Environmental Defence Interrogatory #12 found at Exhibit I.A4.EGD.ED.12.
The information provided below is the historical data as used for network planning.

Table 1 (please see attachment) provides a summary of the historical and forecast derived peak load in m^3/hr from 2006 to 2025. This table shows peak load by customer type for all customers in the GTA Project Influence Area.

The Company does not have further breakdowns of the commercial sector for peak demand.

Data has only been provided for 2006 onward as EGD implemented a new load gathering system. Prior to 2004, load gathering was completed on a legacy main frame system and the archived data is not readily accessible. From 2004 to 2006 there were numerous changes in customer classifications which make year to year comparisons irrelevant due to changing base data. The load presented excludes unbundled customers.

The conversion from m^3 to GJ as found in the EGD rate handbook is 37.69 MJ/m^3

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #6

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive the actual/forecast hourly demands (TJ/hour) for all customers in the GTA Project Influence Area for the 10 days of each year containing the highest peak hourly demand. Please also provide (a) a breakdown by residential, commercial, apartment and industrial customers, and (b) a further breakdown of the commercial customers by subsets such as offices, retail, hospitals, schools, etc. Please provide the data in an electronic spreadsheet.

RESPONSE

Please the response to Environmental Defence Interrogatory #5 found at Exhibit I.A4.EGD.ED.5.

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #7

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive the actual/forecast *total peak day* demands (TJ/day) and average peak day demands (GJ/day) of Enbridge's: a) residential; b) commercial; c) apartment; and d) industrial customers in the GTA Project Influence Area. Please also provide the total peak day demands for all of these customers for each year from 2000 to 2025 inclusive.

RESPONSE

Peak load by sector is not measured on an hourly or daily basis. The Company does derive some of this data for network planning purposes as per the response to Environmental Defence Interrogatory #12 found at Exhibit I.A4.EGD.ED.12. The information provided below is the historical data as used for network planning.

Table 1 (please see attachment) provides a summary of the historical and forecast derived peak load in m^3/d from 2006 to 2025. This table shows peak load by customer type for all customers in the GTA Project Influence Area.

Data has only been provided for 2006 onward as EGD implemented a new load gathering system. Prior to 2004, load gathering was completed on a legacy main frame system and the archived data is not readily accessible. From 2004 to 2006 there were numerous changes in customer classifications which make year to year comparisons irrelevant due to changing base data. The load presented excludes unbundled customers.

The conversion from m^3 to GJ as found in the EGD rate handbook is 37.69 MJ/m^3.

Witness: E. Naczynski

Table 1

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #8

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 4, Table 1

Please provide for each year from 2000 to 2025 inclusive the actual/forecast *total annual* demands (TJ/year) and average annual demands (GJ/year) of Enbridge's: a) residential; b) commercial; c) apartment; and d) industrial customers in the GTA Project Influence Area. Please also provide the total annual demands for all of these customers for each year from 2000 to 2025 inclusive.

RESPONSE

Pipeline and facilities requirements are based on total peak hourly demand. For the purpose of this application, annual demand by sector is only an input into the economic feasibility analysis. The summary of the economic feasibility input parameters, including average annual demand by sector, are shown at Exhibit E, Tab 1, Schedule 2, pages 8 and 9. The Company's feasibility parameters are pursuant to the Board's Decision in Company's EB-2013-0045 Rate Order.

Witnesses: C. Fernandes
E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #9

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, pages 8 & 9

Enbridge states that the "total forecast peak day demand, shown in Table 3, is the incremental load growth plus the load required by the existing customer base."

a) Does Enbridge's forecast assume that the demand from existing buildings will increase, decrease, or remain constant? Please explain why.

b) For each year from 2014 to 2025, please provide the forecast *total peak hour* demands (TJ/hour) and average peak hour demands (GJ/hour) from: a) the above-described incremental load growth from new customers, and b) Enbridge's existing customer base in the GTA Project Influence Area. Please also break out your results by residential, commercial, apartment and industrial customers.

c) Please also provide the requested data in a table covering only the period from 2015 to 2025. This will assist in comparing the data with Enbridge's load forecast at Exhibit A, Tab 3, Schedule 4, which covers only the 2015 to 2025 period.

RESPONSE

a) The Company utilizes peak hour demand rather than annual demand for network planning purposes. Forecast peak hourly loads for existing customers are assumed to be constant for network planning. Incremental customers by sector are assumed to have lower peak hourly demands based on the year added as per the load gathering process described in the response to Environmental Defence Interrogatory #12 found at Exhibit I.A4.EGD.ED.12. Efficiency gains for the system as a whole are incorporated in the incremental peak demand through the reduction factor as per the response to Environmental Defence Interrogatory #13 found at Exhibit I.A4.EGD.ED.13.

Witness: E. Naczynski

b) Please refer to the response to Environmental Defence Interrogatory #13 found at Exhibit I.A4.EGD.ED.13 for average by municipality and sector and to the response to Environmental Defence Interrogatory #3 and #5 found at ExhibitI.A4.EGD.ED.3 and Exhibit I.A4.EGD.ED.5 for incremental and total loads by sector.

c) Please see response to b) above.

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #10

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 5, page 9

Please provide an electronic spreadsheet with the *hourly* demands (TJ/hour) in the GTA Project Influence Area for each hour in 2010, 2011, and 2012. Please provide the data in a single row or column for each year for graphing purposes. Please provide similar forecast data for 2013, 2014, 2015 and 2016.

RESPONSE

Please see the Attachment for hourly demands in the GTA Project Influence Area for each hour of each day in the years 2010 to 2012. Enbridge is unable to provide hourly forecast hourly data for the period 2013 to 2016. The Company's budgeting process does not break out demand by gate station on an hourly basis.

Enbridge has provided the Intervenor with the electronic spreadsheet.

Witness: J. Denomy

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #11

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 5, page 9

Please provide an electronic spreadsheet with the *daily* demands (TJ/day) in the GTA Project Influence Area for each day in 2010, 2011, and 2012. Please provide the data in a single row or column for each year for graphing purposes. Please provide similar forecast data for 2013, 2014, 2015 and 2016.

RESPONSE

Please see the attachment for daily demands in the GTA Project influence area for the period 2010 to 2012. Enbridge is unable to provide forecast daily data for the period 2013 to 2016. The Company's budgeting process does not break out demand by gate station on a daily basis.

Enbridge has provided the Intervenor with the electronic spreadsheet.

Witness: J. Denomy

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #12

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 1

Please fully describe the methodology and assumptions for Enbridge's annual residential, commercial, apartment and industrial customer load growth forecasts from 2013 to 2025 inclusive in the GTA Project Influence Area. Please provide all written analyses and spreadsheets justifying the forecast.

RESPONSE

The Company does not measure peak hourly or daily consumption for the vast majority of its customers. Peak hourly load growth is derived from actual customer consumption volumes extracted from Enbridge's billing system. The customer consumption volumes are used to derive the peak hourly consumption forecast.

An extract of 24 months of actual customer consumption volumes and corresponding temperature readings are used in a mathematical regression to determine the base load and heat load for each customer. The base load and heat load are aggregated to sector (residential, apartment, commercial, industrial) within each municipality every year. These two values collectively result in peak hourly consumption estimates that are applied accordingly within the study area for the forecast period. A summary of peak hour consumptions broken down by customer sector and municipality is included in the response to Environmental Defence Interrogatory #13 found at Exhibit I.A4.EGD.ED.13. The customer additions forecast has been provided in the response to Environmental Defence Interrogatory #2 found at Exhibit I.A4.EGD.ED.2. A summary of total load in the influence area and by customer sector is included in the response to Environmental Defence Interrogatory #13 found at Exhibit I.A4.EGD.ED.13.

The network analysis model also factors in the declining average use consumption trend. The declining average use is calculated through a mathematical regression using

the last five years of derived peak hourly consumption estimates by municipality by, customer sector. This declining average use values are then applied to forecast customer additions throughout the study period. The network analysis models are refreshed on an annual basis to factor in updated values for peak hourly consumption.

For the purposes of the GTA Project an additional reduction factor was also applied to the future load additions. This reduction factor is explained in Environmental Defence Interrogatory #13 found at Exhibit I.A4.EGD.ED.13 part c).

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #13

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, pages 7 & 8

a) Please provide the peak hourly consumption data, by municipality and customer type, that was used to forecast to future demand.

b) Please provide the temperature information and the regression analysis that was used to determine peak hourly gas consumption at 41 DD.

c) Please provide the reduction factor that was used to account for efficiency gains through DSM and customer losses through building demolition. Please provide a breakout of these two components of the reduction factor and fully explain how they were calculated.

d) Does the DSM reduction factor just include DSM reductions due to Enbridge's DSM programs? Or does it also include DSM reductions due to other factors such as changes to building codes, the BOMA BESt Program, REALpac 20 By 15 Energy Benchmarking Program etc.? If not, please estimate the impact of all the other DSM programs and policies on the total annual demand and peak hourly demand for natural gas in the GTA Project Influence Area for each year between 2013 and 2025 inclusive. Please also explain how and to what extent, if any, the reductions from other DSM programs and policies are accounted for in Enbridge's forecast.

RESPONSE

a) Peak load by sector is not measured on an hourly or daily basis. The Company does derive some of this data for network planning purposes as per the response to Environmental Defence Interrogatory #12 found at Exhibit I.A4.EGD.ED.12. The information provided below is the historical data as used for network planning.

Witnesses: C. Fernandes
E. Naczynski

Table 1 (please refer to Attachment) provides a summary of the derived peak hourly load in m^3/hr from 2006 to 2025. This table shows peak load by customer type and municipality in the GTA Project Influence Area.

Data has only been provided for 2006 onward as EGD implemented a new load gathering system. Prior to 2004, load gathering was completed on a legacy main frame system and the archived data is not readily accessible. From 2004 to 2006 there were numerous changes in customer classifications which make year to year comparisons irrelevant due to changing base data. The load presented excludes unbundled customers.

b) Please refer to Exhibit D2, Tab 4, Schedule 2 found in the Company's approved rate application EB-2011-0354.

c) The reduction factor is designed to capture reduction of peak load due to energy efficiency measures. Energy efficiency typically accounts for resource reduction over a long unit of time, such as an annualized basis. It is not analyzed on time periods as short as a day nor an hour. Additionally, customer usage is not typically measured in short time intervals, with the typical customer having billing data available on a monthly basis. The reduction factor was developed using gate station daily demand trends in the GTA to account for the lower peak values aggregated from the network planning process as described in the response to Environmental Defence Interrogatory #12 found at Exhibit I.A4.EGD.ED.12.

Using monthly historical data, the reduction factor multiplier was found to be 0.65. This was applied to the aggregated incremental loads and was applied to specifically reduce the overall peak system load to incorporate the impact of efficiency measures across the GTA Project Influence Area.

d) Please refer to answer c) above.

Witnesses: C. Fernandes
E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #14

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 8

a) For each year from 2014 to 2025 inclusive, please state the forecast impact of DSM on peak hourly demand and total annual demand in the GTA Project Influence Area, both yearly and cumulative, based on the "reduction factor" used by Enbridge in its forecast. For each year, please also estimate Enbridge's DSM budget needed to achieve the DSM reductions assumed in the forecast.

b) Please state the amount of DSM, in addition to that assumed in Enbridge's forecast, that would be needed to meet Enbridge's customers' needs in the GTA Project Influence Area in each year from 2014 to 2025 inclusive (i.e. to ensure that minimum system requirements with respect to capacity and pressure are met) without the proposed new Enbridge pipelines.

c) Has Enbridge estimated the potential for incremental DSM in addition to the amount assumed in its forecast? If yes, please state this potential for each year from 2014 to 2025 inclusive. Please also provide all the reports, studies and analyses that support these estimates and state when this research was commenced and was completed.

d) For each of the above, please also provide the requested data in a table or tables covering only the period from 2015 to 2025. This will assist in comparing the data with Enbridge's load forecast at Exhibit A, Tab 3, Schedule 4, which covers only the 2015 to 2025 period

RESPONSE

a) Enbridge reports DSM using annual figures and does not communicate, measure, or interpret DSM reductions on a peak day or peak hour basis. For illustrative

Witnesses: T. Maclean
F. Oliver-Glasford
J. Ramsay

purposes, the Company has converted its annual results into peak hour and peak day reductions using several theoretical assumptions. The assumptions include:

- the use of a linear conversion ratio to derive peak day from annual figures and peak hour from peak day;
  - In practice the conversion ratio will not be linear and will vary between DSM measures and customer segments
- the use of a factor to apportion the amount of the whole franchise-wide DSM which is attributable to the GTA Project Influence Area; and
- static cost effectiveness as conservation budgets increase (i.e. each incremental m^3 saved is priced at the same as the first m^3).

Because of the theoretical and simplified nature of the assumptions built into the numbers, the charts below should only be used to illustrate the relative magnitude of the data.

Franchise-wide DSM		2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025

Annual Demand Reductions (10^3m^3)	Yearly	35,689	36,504	36,504	36,504	36,504	36,504	36,504	36,504	36,504	36,504	36,504	36,504	36,504
	Cumulatively	35,689	72,193	108,697	145,200	181,704	218,207	254,711	291,215	327,718	364,222	400,726	437,229	473,733
GTA Influence Area DSM Budget		$15,542,541	$15,824,016	$16,140,496	$16,463,306	$16,792,572	$17,128,424	$17,470,992	$17,820,412	$18,176,820	$18,540,357	$18,911,164	$19,289,387	$19,675,175

As shown in the GTA Project Influence Area DSM table above, the impact of the Company's forecasted 2014 DSM reduction on peak hour demand is 12 10^3m^3/hr.

In comparison, the peak load demand reduction as calculated using the reduction factor impact is 13 10^3m^3/hr.

Witnesses: T. Maclean
F. Oliver-Glasford
J. Ramsay

b) In the table below are estimates of the DSM reductions that would be necessary in the GTA Project Influence Area in order to meet the Company's customers' growth needs from 2014 to 2025 inclusive (i.e. to meet a 'growth only' scenario) without the pipelines proposed, holding all other factors constant.

Enbridge asserts that the enormous DSM reductions required to meet customers' needs without the proposed pipeline far exceed any realistic or achievable level.

The data below assumes that the realm of available natural gas savings in the GTA Project Influence Area is unlimited and that cost effectiveness is static. The Company knows this not to be the case. Furthermore, significant portions of the Company's results are achieved through industrial customers of whom there are limited quantities. It is for these reasons among others that conservation was discounted as a non-viable option to offset the GTA Project.

DSM Required to Offset Growth in the GTA Project Influence Area		2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Additional Annual DSM Needed in GTA (10^3m^3)		77,811	77,811	77,811	77,811	77,811	77,811	77,811	77,811	77,811	77,811	77,811	77,811
Total Franchise-wide Annual DSM Needed (10^3m^3)		153,860	153,860	153,860	153,860	153,860	153,860	153,860	153,860	153,860	153,860	153,860	153,860
Total DSM Budget Needed	Yearly	$66,697,115	$68,031,057	$69,391,679	$70,779,512	$72,195,102	$73,639,004	$75,111,785	$76,614,020	$78,146,301	$79,709,227	$81,303,411	$82,929,479
	Cumulatively	$66,697,115	$134,728,173	$204,119,851	$274,899,363	$347,094,466	$420,733,470	$495,845,255	$572,459,275	$650,605,576	$730,314,802	$811,618,214	$894,547,693

c) The Company completed a DSM Potential Study in 2009. (The study commenced in 2008.) The Potential Study covered the period 2008 through 2017 using the base year of 2007. The Study Report was filed with the 2012 DSM Plan (EB-2011-0295, Exhibit B, Tab 2, Schedule 7).

d) Please see the table above for 2015 to 2025.

1. INTRODUCTION

1.1 BACKGROUND AND OBJECTIVES

Enbridge Gas Distribution (Enbridge) is the largest natural gas utility in Canada with 1.9 million residential, commercial and industrial customers. Enbridge is a regulated utility with a Service Area in central and eastern Ontario that includes the cities of Toronto and Ottawa and the Niagara Region. Enbridge distributes approximately 13 billion m^3 of natural gas to its customers annually.

Since 1995, Enbridge has been delivering demand side management (DSM) programs to its customers following a decision of the provincial regulator, the Ontario Energy Board (OEB). Enbridge offers DSM programs to all customer rate classes and across all sectors.

Enbridge has been participating in a market of increasing DSM program maturity. This market is continually evolving in its engagement with energy efficiency through growing voluntary initiatives and more stringent codes and standards. In addition, changes in the economy have started to have negative impact on the commercial and industrial marketplace in Enbridge's Service Area.

In the DSM Generic Proceeding held in 2006, Enbridge committed to creating an updated Market Potential Study for input into the next DSM plan. When completed, the results of this Natural Gas Energy Efficiency Potential Study will provide a foundation that Enbridge can use to guide the development of its longer-term DSM strategy, including new programs. More specifically, this includes support for Enbridge's filing to the OEB regulatory application for the next multi-year DSM plan by:

- Estimating the achievable and economic potential for DSM measures across all applicable technologies, markets and sectors in Enbridge's Service Area
- Giving shape to, and refining ongoing energy-efficiency work by Enbridge in order to develop its next multi-year DSM plan, and
- Provide information that is actionable and can be easily converted to plan and program development.

1.2 STUDY SCOPE

This current study (Update 2008) is an update of the earlier Natural Gas Efficiency Potential Study that was completed for Enbridge in 2006. Consequently, to the extent possible, this study employs the same methodology, sector definitions, facility archetypes and geographical coverage as in the previous study. Additional details are provided below:

- **Sector Coverage:** The study addresses three sectors: Residential, Commercial[1] and Industrial.

[1] Throughout this report the term "Commercial" also includes institutional sectors, such as schools, hospitals, etc., unless otherwise noted.

- **Geographical Coverage**: The study results are presented for the total Enbridge Service Area and for two service regions: Central and Eastern. The study results are presented at the level of individual service region due to differences in building stock and weather conditions (heating degree days) that exist in the two regions.

  The Central service region is dominated by the Greater Toronto Area, but also includes customers in the Niagara region. Major municipalities in the Central service region include: Metropolitan Toronto (01), Mississauga (21), Richmond Hill (35), Whitby (45), and Niagara (76). The Eastern region is dominated by the City of Ottawa. Major municipalities in the Eastern service region include: Peterborough (47), Barrie (53), and Ottawa (65).

- **Study Period**: This study covers a 10-year period. The Base Year is the calendar year 2007, with milestone periods at five-year increments: 2012 and 2017. The Base Year of 2007 was selected, as this was the most recent calendar year for which complete customer data were available.

- **Technologies:** The study addresses the full range of natural gas energy efficiency measures together with selected renewable energy technologies that are currently commercially available, or are expected to be available within the first 5 years of this study period.

  The study also provides a high-level treatment of selected emerging technologies. Although it is not expected that these emerging technologies will significantly affect results in this study period, they provide insight into possible future directions that may influence the market for higher efficiency products.

1.2.1 Caveats

Readers are reminded of the following caveats when reviewing the results presented in this report:

- Energy Efficiency Potential studies, such as this one, provide a "big picture" assessment of the scope of energy efficiency opportunities within a specific service area. They are particularly valuable in identifying the level of aggregate savings, the key measures involved, their costs and the relative priority of individual sub markets and technologies. Because these studies must assess literally hundreds of combinations of technologies and sub markets, the assessment is necessarily high level. As such, these study results are intended to provide a foundation for detailed program design, but it must be emphasized that detailed program design requires substantial additional analysis.

- During the completion of this study, the world economy entered a period of unprecedented uncertainty that may have significant impact on the results of this study, particularly in the short term. For example, key factors underlying Enbridge's load forecast and the study's Reference Case such as gross domestic product (GDP), energy prices, new construction etc. may change. The net effect of these changes

would be lower levels of future natural gas consumption. Similarly, the participation rates estimated during the Achievable Potential workshops do not explicitly take into account changes in consumer outlook as a result of the economic downturn. Although neither the extent nor the duration of the economic downturn is known at this time, the expected impact would be lower consumer spending and, hence, lower program participation rates than those presented in this report. The precise magnitude of the reduced program participation is unknown at this time.

- The analysis was conducted based on the current and expected future participation of other industry partners such as the federal government, led by Natural Resources Canada, the Ontario government, and the Ontario Power Authority (OPA). At the time of this writing, the future energy efficiency strategies and complementary programs to be pursued by these agencies is not certain. Over the duration of this forecast, impacts due to the changing roles of industry partners should be assessed from time to time and, in particular, should be included within Enbridge's following multi-year plan.

- The inclusion of natural conservation in the study's Reference Case does address some, but not necessarily all, free rider and spillover impacts. A more detailed assessment of free rider impacts is practical only as part of a detailed program design, which is beyond the scope of this study.

- As in any study of this type, the results presented in this report are based on a large number of important assumptions. Assumptions such as those related to the current and forecast costs of natural gas, the current penetration of energy efficient technologies, the rate of future economic growth and customer willingness to implement new energy efficiency measures are particularly influential. Wherever possible, the assumptions used in this study are consistent with those used by Enbridge and are based on best available information, which in many cases includes the professional judgement of the consultant team, client personnel and/or local experts. The reader should use the results presented in this report as best available estimates; major assumptions, information sources and caveats are noted throughout the report.

1.3 DEFINITIONS

This study employs numerous terms that are unique to analyses such as this one and consequently it is important to ensure that all readers have a clear understanding of what each term means when applied to this study. Below is a brief description of some of the most important terms.

Base Year Natural Gas Use The Base Year is the starting point for the analysis. It provides a detailed description of "where" and "how" natural gas is currently used in each sector. The bottom up profile of energy use patterns and market shares of energy using technologies was calibrated to actual Enbridge customer sales data.

Reference Case Forecast The Reference Case is a projection of natural gas consumption to 2017, in the absence of any new Enbridge DSM market interventions after 2008. It is the baseline against which the scenarios of energy savings are calculated. The Reference case forecast incorporates an estimation of "natural conservation", namely, changes in end use efficiency over the study period that are projected to occur in the absence of new market interventions by Enbridge.

Measure Total Resource Cost The Measure TRC calculates the net benefits that result from an investment in an efficiency technology or measure. The measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy, water and equipment O&M costs. This calculation includes, among others, the following inputs: the avoided natural gas, electricity and water supply costs, the life of the technology, and the selected discount rate, which in this analysis has been set at 9.14%.

The Measure Total Resource Cost (TRC) test is the primary determinant of whether a measure is included in the economic potential.

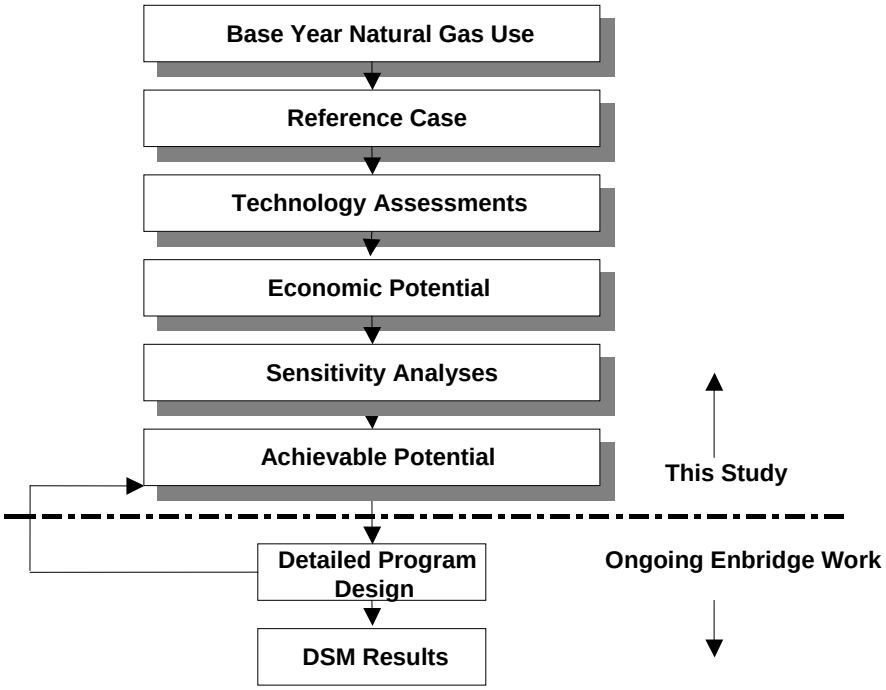
Economic Potential Forecast The Economic Potential Forecast is the level of natural consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost-effective from Enbridge's perspective. All the energy efficiency technologies and measures that have a positive measure TRC are incorporated into the Economic Potential Forecast. These technologies and measures are applied at either natural stock turnover rates or at designated years for immediate application.

Achievable Potential The Achievable Potential is the proportion of the natural gas savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is practically difficult to induce customers to purchase and install all the efficiency technologies that meet the criteria defined by the Economic Potential Forecast.

1.4 APPROACH

To meet the objectives outlined above, the study was conducted through an iterative process that involved a number of well-defined steps. At the completion of each step, the client reviewed the results and, as applicable, revisions were identified and incorporated into the interim results. The study then progressed to the next step. A summary of the steps is presented in Exhibit 1.1 and briefly discussed below.

Exhibit 1.1: Major Study Steps



Step 1: Develop Base Year Calibration Using Actual Enbridge Sales Data

The Base Year (2007) is the starting point for the analysis. It provides a detailed description of "where" and "how" natural gas is currently used, based on actual natural gas sales.

The consultants compiled the best available data and used sector-specific macro models to estimate natural gas use; they then compared the results to the Enbridge's actual billing data to verify their accuracy.

Step 2: Develop Reference Case

The Reference Case uses the same sector-specific macro models to estimate the expected level of natural gas consumption that would occur over the study period with no new (post-2007) Enbridge DSM initiatives. The Reference Case includes projected increases in natural gas consumption based on expected rates of population and economic growth, using the growth rates included in the Enbridge 2007 load forecast. The Reference Case also makes an estimate for some "natural" conservation, that is, conservation that occurs without Enbridge DSM programs. The Reference Case provides the point of comparison for the calculation of Technical, Economic and Achievable natural gas saving potentials.

Step 3: Assess DSM Technologies

The consultants researched a wide range of commercially available DSM technologies and measures that can enable the Enbridge customers to use natural gas more efficiently. For each DSM technology or measure, the consultants calculated a value for the net benefits per year per cubic meter (m^3) of saved natural gas, referred to as the measure Total Resource Cost (TRC).

This approach allowed the consultants to compare the measure TRC benefits with other natural gas efficiency technologies and measures, and to determine whether or not to include the DSM measure in the Economic Potential Forecast. Only technologies and measures with positive TRC benefits were included in the Economic Potential Forecast.

Step 4: Estimate Economic Natural Gas Savings Potential

The Economic Potential Forecast incorporates all "cost-effective" DSM measures reviewed in Step 3. To forecast the potential natural gas savings that are defined as economic, the consultants used the sector-specific macro models to calculate the level of natural gas consumption that would occur if Enbridge's customers installed all "cost-effective" technologies. "Cost effective" for the purposes of this study means that the measure has a positive measure TRC.

Step 5: Conduct Sensitivity Analysis

The results presented in the Economic Potential Forecast are sensitive to the assumptions employed. Consequently, in consultation with Enbridge personnel, the Economic Potential results were subjected to a sensitivity analysis around two assumptions:

- **Technology Costs:** The Economic Potential Forecast was re-run using the most energy efficient technologies and measures assessed in Step 3, regardless of their current capital and installation costs (i.e., the most efficient technologies were included, even if they had a negative measure TRC value).[2] However, to ensure a measure of practical reality and basis for comparison with the preceding economic potential results, the technology adoption rates employed in this analysis are the same as those defined in the preceding economic potential forecast.

[2] In Enbridge's previous (2004) DSM Potential study, this analysis was reported as a separate Section entitled Technical Potential. The method and assumptions applied to current sensitivity analysis are the same as in the previous (2004) Technical Potential analysis.

- **Value of GHG Emissions**: The natural gas avoided cost values that were used to determine the measure TRC results presented in Step 4 do not include a value for greenhouse gas (GHG) emissions. However, the Government of Ontario has committed to aggressive GHG reduction targets. In this future context, it is not unreasonable to expect that future measure TRC calculations may incorporate a greenhouse gas (GHG) adder that accounts for carbon dioxide emissions resulting from natural gas consumption. Consequently, the measure TRC calculations were re-run using an avoided supply cost value that incorporates a GHG adder.

  The value of the GHG adder was set at \$15/tonne CO_2e (per tonne of CO_2 equivalent emissions) for the period 2007 to 2012 and \$20 /tonne CO_2e for the period 2013-2017. An emissions coefficient of 0.001903 tonnes CO_2e/m^3 (1903 g CO_2e/m^3) is used to account for carbon dioxide emissions resulting from natural gas consumption, while an emissions coefficient of 0.000220 tonnes CO_2e/kWh (220 g CO_2e/kWh) represents the average carbon dioxide emissions from electricity production in Ontario.[3, 4]

Step 6: Estimate Achievable Natural Gas Savings Potential

The Achievable Potential is the proportion of the savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. The study assessed achievable natural gas savings potential from two perspectives:

- ***Potential Savings in Future Natural Gas Consumption:*** For this perspective, the study calculated the change in natural gas consumption levels that could occur in a given milestone year due to the aggregate impact of **all** measures implemented over the period from the Base Year (2007) to the Milestone Year (2012 or 2017). This perspective provides Enbridge Gas with an estimate of future natural gas consumption under different levels of DSM investment.

  This portion of the analysis calculated savings relative to the Reference Case (i.e., no new DSM), which is consistent with the approach used to estimate savings under the Economic Potential forecast and the sensitivity analyses described above in Steps 4 and 5.

- ***Potential DSM Program TRC Benefits***: For this perspective, the study calculated the potential natural gas savings in accordance with the provisions defined by the Ontario Energy Board (OEB) and employed by Enbridge when submitting its DSM plan to the OEB. This perspective emphasizes the estimation of net TRC benefits and the annual natural gas savings presented are due to those measures installed in (only) a given milestone year (i.e., 2012 or 2017).

[3] Based on emission factors and Global Warming Potentials (GWPs) presented in Environment Canada, National Inventory Report (1990-2005): Greenhouse Gas Sources and Sinks in Canada", pgs. 23 and 583, April 2007.

[4] Based on Ontario emission factors presented in Environment Canada, National Inventory Report (1990-2005): Greenhouse Gas Sources and Sinks in Canada", pg. 521, April 2007.

Within each of the above perspectives, the analysis of Achievable Potential was assessed under four different Marketing scenarios:

- One Financially Unconstrained scenario
- Three Financially Constrained scenarios, each limited by a different annual program budget, which for this study were set at $20 million, $40 million and $60 million.

Data on the costs and savings for each measure were combined with participation rates identified in the achievable workshops to generate measure-by-measure estimates of potential savings. These results were then compiled into a table and ranked according to TRC benefits per program dollar from least cost to most costly. From this table it was then possible to identify the most cost effective portfolio of measures at the $20 million, $40 million, $60 million and Financially Unconstrained budget levels together with the annual natural gas savings and net TRC benefits associated with each program budget level.[5]

The potential savings in future natural gas consumption were then calculated by selecting only those measures contained in the above table that passed at each budget level and milestone year. That package of measures was then applied in each of the sector models and the results were compared with those in the Reference Case and Economic Potential forecasts.

Further information on each of the Marketing scenarios is provided in each of the sector specific sections of this report.

1.5 STUDY ORGANIZATION AND REPORTS

The study was organized and conducted by sector using a common methodology, as outlined above. Following this introductory section, the remainder of this Synthesis Report is organized as follows:

- Section 2 presents the combined natural gas savings for the three sectors.
- Section 3 presents a summary of the natural gas savings for the Residential sector.
- Section 4 presents a summary of the natural gas savings for the Commercial sector.
- Section 5 presents a summary of the natural gas savings for the Industrial sector.

[5] There are numerous possible approaches to the selection of program measures; this approach was selected for simplicity and clarity.

2. SUMMARY OF STUDY FINDINGS

The study findings confirm the existence of significant remaining cost-effective natural gas DSM opportunities in the Residential, Commercial and Industrial sectors within Enbridge's service area.

2.1 TOTAL NATURAL GAS SAVING POTENTIAL

As presented previously in Section 1, the study estimated natural gas savings potential from two perspectives.

- **Potential Savings in Future Natural Gas Consumption** – This perspective estimates the reductions in future natural gas consumption based on the aggregate impact of DSM measures implemented over the study's 10-year time period.

- **Potential DSM Program TRC Benefits –** This perspective estimates the total lifetime savings due to those measures installed in (only) a given milestone year (i.e., 2012 or 2017). This is the method employed in the calculation of net TRC benefits and is part of the DSM program portfolio design process.

The savings associated with each perspective are summarized below.

2.1.1 Potential Savings in Future Natural Gas Consumption

Exhibits 2.1 and 2.2 provide a summary of the total annual natural gas consumption levels contained in each of the forecasts addressed by the study.[6]

Exhibits 2.3 and 2.4 provide a summary of the potential natural gas savings under each of the potential scenarios; in each case savings are presented in both volumetric (m^3) and percentage terms. In each case the savings shown are annual and are based on the aggregate impact of measures installed in prior years within the period when compared to the Reference Case consumption levels.

As illustrated in Exhibits 2.1 to 2.4, inclusive, Achievable Potential savings increase only marginally beyond the $40M scenario. Based on the Achievable Potential workshop results, few additional savings were identified in the $60M scenario and Financially Unconstrained scenarios, while maintaining a positive TRC.

[6] Note: Actual results may not be linear as shown in Exhibits 2.1 and 2.2.

Exhibit 2.1: Graphic of Forecast Results for the Total Enbridge Service Area – Annual Natural Gas Consumption

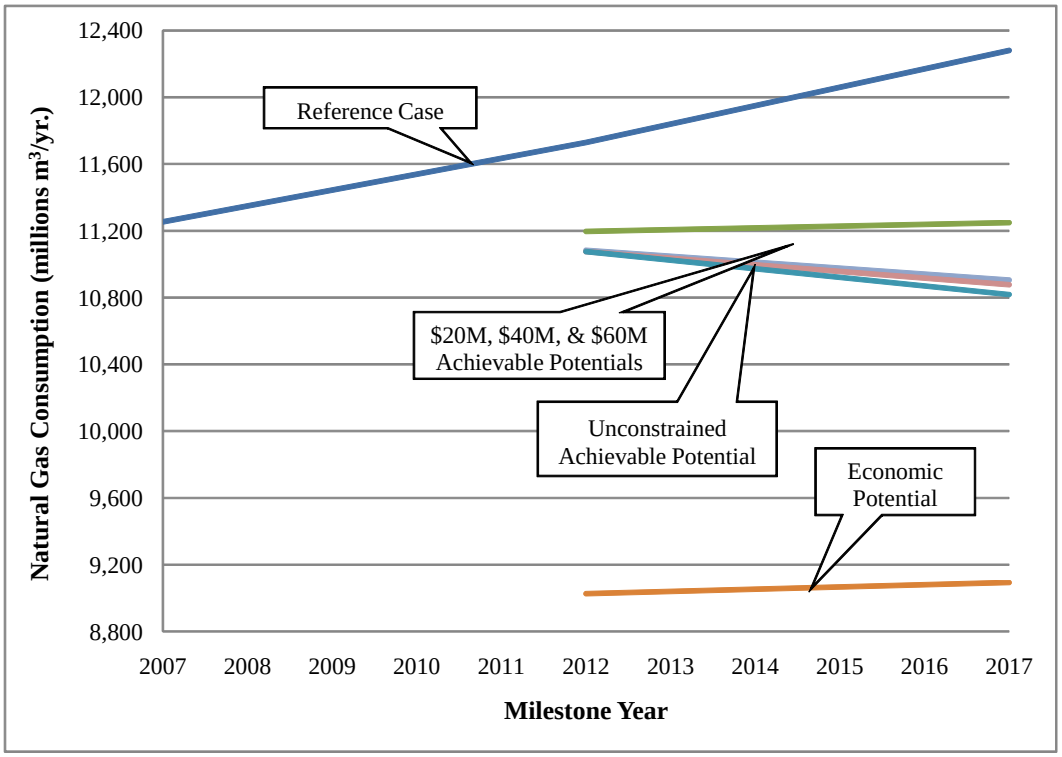


Exhibit 2.2: Total Annual Natural Gas Consumption, by Milestone Year and Forecast Scenario, 3 Sectors

Milestone Year	Total Annual Natural Gas Consumption, All Sectors (million m^3/yr.)					
	Reference Case	Economic Potential	Achievable Potential			
			$20M Scenario	$40M Scenario	$60M Scenario	Financially Unconstrained
2007	11,254					
2012	11,728	9,026	11,197	11,083	11,076	11,076
2017	12,280	9,093	11,249	10,905	10,877	10,818

Exhibit 2.3: Total Natural Gas Savings, in the Milestone Years and Forecast Scenario Relative to Reference Case and Economic Potential Forecasts, 3 Sectors

Milestone Year	Natural Gas Savings, All Sectors (million m^3/yr. vs. Ref Case, % vs. Ref. Case and Econ. Potential)				
	Economic Potential	Achievable Potential Scenarios			
		$20M Scenario	$40M Scenario	$60M Scenario	Financially Unconstrained
2012	2,703	532	645	652	652
2017	3,188	1,032	1,375	1,404	1,463
Savings as % of Reference Case Consumption					
2012	23%	5%	6%	6%	6%
2017	26%	8%	11%	11%	12%
Savings as % of Economic Potential Savings					
2012		20%	24%	24%	24%
2017		32%	43%	44%	46%

Note**:** Natural gas savings in the milestone years represent the potential reduction in gas use in that year as a result of DSM measures implemented in the period. Achievable Potential savings increase only marginally beyond the $40M scenario. Based on the Achievable Potential workshop results, few additional savings were identified in the $60M scenario and Financially Unconstrained scenarios, while maintaining a positive TRC.

Exhibit 2.4: Distribution of Natural Gas Savings, by Sector and Scenario in 2017, 3 Sectors

Sector	Natural Gas Savings, 2017 (million m^3/yr. vs. Ref Case, % of Econ. Potential Savings)				
	Economic Potential	Achievable Potential Scenarios			
		$20M Scenario	$40M Scenario	$60M Scenario	Financially Unconstrained
Residential	842	237	268	296	355
Commercial	1,427	440	715	715	715
Industrial	919	355	392	392	392
Total	3,188	1,032	1,375	1,404	1,463
Achievable Savings as % of Economic Potential Savings					
Residential		28%	32%	35%	42%
Commercial		31%	50%	50%	50%
Industrial		39%	43%	43%	43%
Total		32%	43%	44%	46%

Note**:** Natural gas savings in the milestone years represent the potential reduction in gas use in that year as a result of DSM measures implemented in the period. Achievable Potential savings increase only marginally beyond the $40M scenario. Based on the Achievable Potential workshop results, few additional savings were identified in the $60M scenario and Financially Unconstrained scenarios, while maintaining a positive TRC.

2.1.2 Potential DSM Program TRC Benefits

Exhibit 2.5 presents a summary of the forecast TRC benefits, annual program costs and natural gas savings in 2017 for each of the achievable scenarios, by scenario and sector. As noted previously, the natural gas savings shown in Exhibit 2.5 are calculated in

accordance with OEB requirements for the filing of DSM plans. Therefore, the savings shown are only for the measures installed in 2017; they do not include the savings in 2017 that occur as a result of measures installed in prior years within the period.

Exhibit 2.5: Forecast Annual Achievable Program Costs[7], Savings[8] and TRC Benefits, by Scenario For Installations Completed in (only) 2017, 3 Sectors

Scenario	Forecast Achievable Program Costs and Savings, 2017				
	Annual Program Cost (millions $)	Gas Savings (million m^3/yr.)	TRC Benefits (million $)	Program Cost per Unit	
				($/$m^3$)	($/TRC$)
Residential (50% of Funding)					
$20M Annually	10.0	21.1	46.4	0.47	0.22
$40M Annually	20.0	27.0	47.2	0.74	0.42
$60M Annually	30.0	32.4	47.9	0.92	0.63
Financially Unconstrained	36.2	35.0	48.0	1.03	0.75
Commercial (30% of Funding)					
$20M Annually	6.0	48.9	168.1	0.12	0.04
$40M Annually	10.9	66.8	202.5	0.16	0.05
$60M Annually	10.9	66.8	202.5	*	*
Financially Unconstrained	10.9	66.8	202.5	*	*
Industrial (20% of Funding)					
$20M Annually	4.0	44.3	44.0	0.09	0.09
$40M Annually	4.4	48.0	44.3	0.09	0.10
$60M Annually	4.4	48.0	44.3	*	*
Financially Unconstrained	4.4	48.0	44.3	*	*
Total (3 Sectors)					
$20M Annually	20.0	114.3	258.5	0.18	0.08
$40M Annually	35.3	141.8	294.0	0.25	0.12
$60M Annually	45.3	147.3	294.7	**	**
Financially Unconstrained	51.5	149.8	294.8	**	**

** Based on the participation rates identified during the Achievable workshop results, all eligible measures are implemented at the program spending level shown.*

*** Values are not calculated as they are skewed by the Commercial and Industrial sector limits.*

2.2 OBSERVATIONS AND IMPLICATIONS

As illustrated in the preceding exhibits, despite a decade of successful DSM program implementation, there remains significant cost-effective DSM potential within Enbridge's service area. This remaining opportunity reflects, in part, continued technology cost and performance improvements over the period. Key study observations are highlighted below.

❑ Economic Potential

The study estimated economic potential savings to be approximately 3,188 million m^3 by 2017, which is approximately 26% relative to the Reference Case. This value is significantly larger than the value estimated in Enbridge's 2004 study; the change reflects a significant

[7] Program costs do not include salary and overhead costs.

[8] The savings shown in Exhibit 2.5 are only for the measures installed in 2017; they do not include the savings in 2017 that occur as a result of measures installed in prior years within the period.

increase in the Commercial sector savings opportunities, which is due to a combination of better information (that enabled better opportunity identification) and technology cost and performance improvements that widened the scope of technologies that passed the economic screen.

- **Achievable Potential Savings - Future Natural Gas Consumption**

Relative to the Reference Case forecast for 2017, the Achievable Potential savings range from about 1,375 million m^3 in the $20 million scenario to approximately 1,463 m^3 in the Financially Unconstrained scenario, which represent 43% and 46%, respectively, of the economic potential savings.

In the residential and commercial sectors, two related factors contribute to the gap between the economic and achievable potential results. First, many of the energy efficiency measures are applicable as existing equipment turns over or new facilities are constructed. This means that during the first few years when programs were deemed to be in the start-up phase, a significant number of lost opportunities occur. Secondly, the study period is relatively short; hence, both the amount of stock turn-over that occurs in the period and the number of years to achieve results is shortened.

- **Potential DSM Program TRC Benefits**

TRC benefits, annual program costs and natural gas savings identified in this study remain in the same orders of magnitude as Enbridge's recent experience, with a general trend towards increasing costs per unit of gas savings.

- Residential sector program costs identified in this study under the $20 million DSM scenario are $0.47/$m^3$ as shown in Exhibit 2.5. This compares with 2007 actual costs that were in the range of $0.32 (gross) to $0.51 per m^3 (net).[9] Residential program costs per unit of gas savings and TRC benefits are significantly greater than in either the Commercial or Industrial sectors. This is also consistent with recent Enbridge results.

- Commercial sector program costs identified in this study under the $20 million DSM scenario are $0.12/$m^3$ as shown in Exhibit 2.5. This compares with 2007 actual costs that were in the range of $0.14 (gross) to $0.11 per m^3 (net). Commercial sector program costs per dollar of TRC benefits are the lowest among the three sectors; however, the sector runs out of cost-effective measures before reaching the limits set within the $40 million or $60 million scenarios. This situation reflects the views of the achievable workshop participants who indicated that participation rates in this sector were limited by market barriers, such as supply chain capacity, split incentives etc., that were particularly challenging.

- Industrial sector program costs identified in this study under the $20 million DSM scenario are $0.09/$m^3$ as shown in Exhibit 2.5. This compares with 2007 actual costs that were in the range of $0.11 (gross) to $0.06 per m^3 (net). Industrial sector program costs are also much lower per unit of gas savings and TRC benefits than in the

[9] Enbridge, 2007 LRAM Post Audit Results.

Residential sector. However, as in the Commercial sector, the Industrial sector also runs out of cost-effective measures before reaching the limits set within the $40 million or $60 million scenarios.

- **Key Technologies and Measures**

In the Residential sector, the measures that provide the most significant contribution to annual savings differ somewhat by milestone year. Measures that offer particularly significant natural gas savings potential in both milestone years include air sealing in older homes, programmable thermostats, and high-performance windows. Measures such as ultra low-flow showerheads provide large savings in 2012 but not in 2017 as they are assumed to have fully penetrated the market by 2017.

In the Commercial sector, recommissioning represents the largest contribution to annual savings in both milestone years. Other measures that offer particularly significant natural gas savings potential in both milestone years include hot water conservation measures and efficient new construction.

In the Industrial sector, three measure bundles provide particularly attractive savings opportunities. They are: upgrading to more efficient boilers and heaters, such as condensing boilers and direct contact hot water heaters; retrofitting ovens, dryers, kilns and furnaces to improve efficiency, such as exhaust gas heat recovery, high efficiency burners, insulation and advanced heating and process controls; and, system wide integrated control systems.

- **Key Markets and Trends**

As the DSM market matures within Enbridge's service area, niche or target markets are becoming increasingly important. Measures that may not pass the TRC test in a "typical" or "average" application often will pass in niche applications. For example:

- Air sealing and insulation in older homes (built before 1980) is one example that was included in this study, as data were available. Similarly, additional domestic hot water measures may be feasible in homes with a larger number of occupants. For example, drain water heat recovery systems and DHW recirculation systems become more economically attractive with larger household sizes. These latter measures have not been included in the current results as suitable data were not available.

Similarly, the sector specific results presented in the following sections indicate that market transformation approaches warrant additional consideration, particularly in the Residential and Commercial sectors. Alternately, opportunities such as those listed below suggest that the composition of the TRC calculation itself may need to be revisited to better consider non-energy benefits. For example:

- In the Residential sector, the technology cost sensitivity analysis showed that there remains an additional untapped potential savings by 2017 of about 1,100 million m^3 from technically mature measures that do not currently pass the TRC screen. The largest share of these additional potential savings is from air sealing and envelope insulation in existing homes. These measures do not pass the TRC screen as currently defined.

However, they provide non-energy benefits such as increased comfort and reduced noise that are not currently captured in the TRC calculation. In addition, industry specialists emphasized that as insulation levels increase, proper air and moisture sealing is becoming increasingly essential to the long-term structural integrity of Ontario's housing stock. This situation presents both an opportunity and a possible technical issue that may be better addressed through a market transformation approach.

- In the Commercial sector, the technology cost sensitivity analysis showed that there remains an additional untapped potential savings by 2017 of about 269 million m^3 from technically mature measures that do not currently pass the TRC screen. The largest share of these additional potential savings are from air sealing and envelope upgrades, including wall insulation and more energy efficient glazing measures in existing buildings. These measures do not pass the TRC screen as currently defined. However, as in the residential sector, the measures provide non-energy benefits such as increased comfort and reduced noise that are not currently captured in the TRC calculation.

In addition, industry specialists emphasized that some emerging technologies, such as solar preheated make-up air may be better addressed in a market transformation context, as they provide "soft" benefits, such as visible contribution to corporate greening goals, which are not included in the TRC calculation.

3. RESIDENTIAL SECTOR

The Residential sector includes single-family detached homes, attached duplex, row and multi-family dwellings and apartments as well as a small number of other dwellings.

3.1 APPROACH

The detailed end-use analysis of energy efficiency opportunities in the Residential sector employed two linked modelling platforms: **HOT2000,** a commercially-supported residential building energy-use simulation software, and **RSEEM** (Residential Sector Energy End-use Model), a Marbek in-house spreadsheet-based macro model.

The major steps in the general approach to the study are outlined in Section 1.4 above (Approach). Specific procedures for the Residential sector were as follows:

- **Modelling of Base Year –** The consultants used the Enbridge customer data to break down the Residential sector by four factors:

  - Type of dwelling (single detached, attached, apartment, etc.)
  - Heating category (natural gas or electric heat)
  - The age of the building
  - Service region.

  To estimate the natural gas used for space heating, the consultants factored in building characteristics such as insulation levels, floor space and air tightness using a variety of data sources, including the Ontario Energuide for Houses database, Enbridge billing data, local climate data and discussions with local contractors. They also used the results of Enbridge customer surveys that provided data on type of heating system, number and age of household appliances, renovation activity, etc. Based on the available data sources, the consultants calculated an average natural gas use by end use for each dwelling type. The consultant's models produced a close match with actual Enbridge sales data.

- **Reference Case Calculations -** For the Residential sector, the consultants developed profiles of new buildings for each type of dwelling. They estimated the growth in building stock using the same data as that contained in the Enbridge most recent load forecast and estimated the amount of natural gas used by both the existing building stock and the projected new buildings and appliances. As with the Base Year calibration, the consultants' projection closely matches Enbridge's own 2007 forecast of future Natural gas requirements.

- **Assessment of DSM Measures –** To estimate the economic and achievable energy savings potentials, the consultants assessed a wide range of commercially available energy efficiency measures and technologies such as:
  - Thermal upgrades to the walls, roofs and windows of existing buildings
  - More efficient space heating equipment and controls
  - Measures to reduce hot water usage
  - Improved designs for new buildings
  - Addition of solar thermal technologies.

3.2 RESIDENTIAL NATURAL GAS SAVINGS POTENTIAL

A summary of the levels of annual natural gas consumption and potential natural gas savings contained in each of the Residential sector forecasts addressed by the study are presented in Exhibits 3.1 to 3.3, and are discussed briefly in the sub sections that follows.

Exhibit 3.1: Graphic of Forecast Results for the Total Enbridge Service Area – Annual Natural Gas Consumption, Residential Sector (million m^3/yr.)

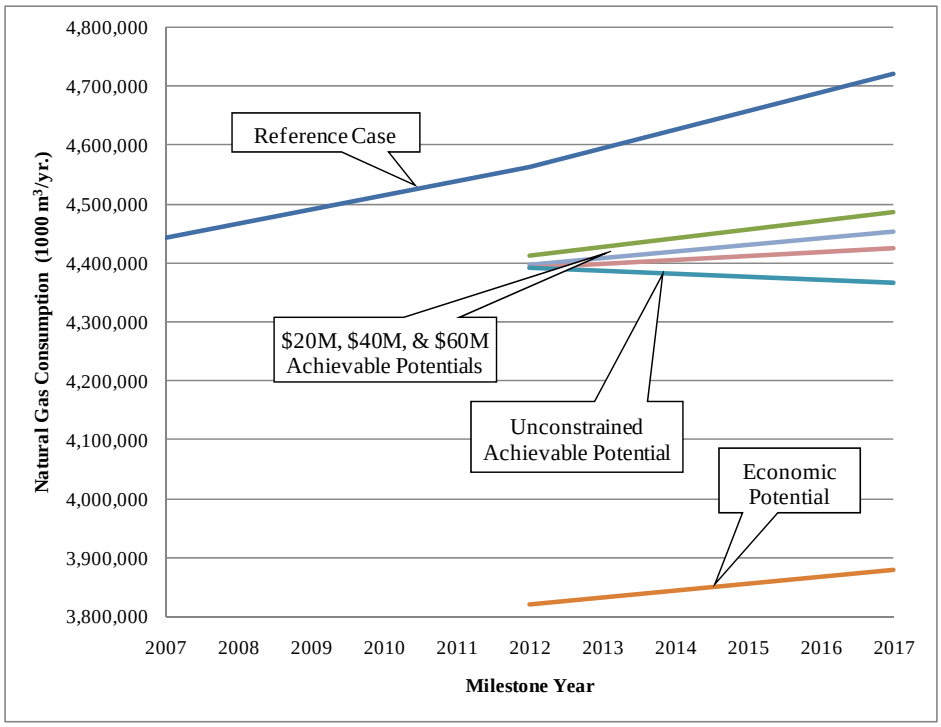

Exhibit 3.2: Summary of Forecast Results for the Total Enbridge Service Area – Annual Natural Gas Consumption, Residential Sector (million m^3/yr.)

Milestone Year	Annual Consumption in Residential Sector (million m^3/yr.)					
	Reference Case	Economic Potential	Achievable Potential			
			$20M Scenario	$40M Scenario	$60M Scenario	Financially Unconstrained
2007	4,442					
2012	4,563	3,820	4,413	4,399	4,392	4,392
2017	4,722	3,880	4,486	4,455	4,426	4,367

Exhibit 3.3: Summary of Forecast Results for the Total Enbridge Service Area – Natural Gas Savings in Milestone Years, Residential Sector (million m^3/yr. and % Relative to Economic Potential Scenario)

Milestone Year	Natural Gas Savings (million m^3/yr. Relative to Ref Case, % Relative to Economic Potential)				
	Economic Potential	Achievable Potential			
		$20M Scenario	$40M Scenario	$60M Scenario	Financially Unconstrained
2012	743	150	165	172	172
2017	842	237	268	296	355
2012		20%	22%	23%	23%
2017		28%	32%	35%	42%

Note**:** Natural gas savings in the milestone years represent the potential reduction in gas use in that year as a result of DSM measures implemented in the period.

3.3 BASE YEAR NATURAL GAS USE

In the Base Year of 2007, the Residential sector in Enbridge's total service area consumed about 4,442,437,000 m^3. Exhibit 3.4 shows that approximately 80% of the natural gas consumption in the residential sector occurs in the Single Family Detached dwellings, and of this amount, the pre-1980 vintage accounts for about 60%. The Duplex/Row/Multi category of housing accounts for approximately 11% of residential natural gas consumption, while Mobile/Other housing accounts for the remaining 9%.

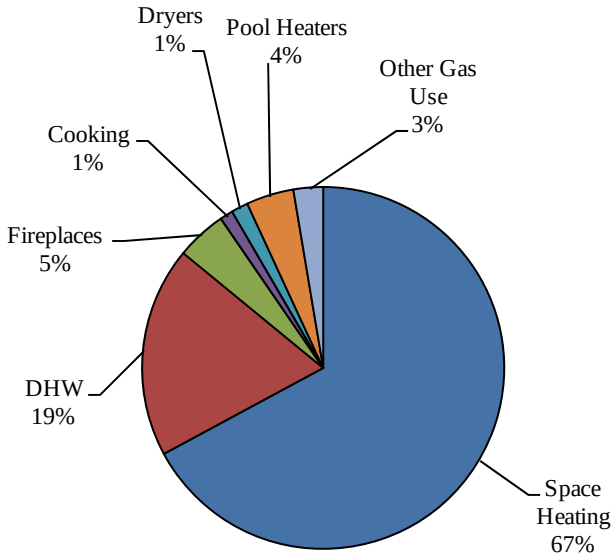
The Central Service region accounts for nearly 80% of the residential natural gas consumption in the Enbridge Gas Service Area.

Exhibit 3.4: Base Year Residential Sector Natural Gas Use for the Total Enbridge Service Area (1000 m^3/yr)

Segment	Space Heating	DHW	Fireplaces	Cooking	Dryers	Pool Heaters	Other Gas Use	Totals
	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.	1000 m^3/yr.
Detached - without gas space heat		16,301	6,310	998	1,326	4,602	2,274	31,812
Detached - pre-1980s	1,519,765	333,235	66,771	22,360	28,196	95,809	47,371	2,113,507
Detached - 1981 to 1993	387,972	133,595	37,598	7,401	10,165	52,379	18,177	647,287
Detached - 1993 to Present	431,296	155,765	64,147	10,478	13,958	35,210	21,556	732,409
Duplex/Row/Multi - no space htg		3,017	503	158	196		436	4,311
Duplex/Row/Multi - pre-1980s	243,499	53,418	4,672	2,996	3,553		7,711	315,849
Duplex/Row/Multi - 1980 or newer	160,787	64,827	10,058	3,383	4,249		9,068	252,372
Other	243,553	73,155	9,174	3,914	4,746		10,347	344,891
TOTAL	2,986,872	833,314	199,234	51,688	66,389	188,000	116,940	4,442,437

As illustrated in Exhibit 3.5 space heating accounts for about 67% of total residential natural gas use. Domestic hot water (DHW) accounts for about 19% of the total natural gas use, followed by fireplaces (5%) and pool heaters (4%). Dryers, cooking ranges and selected other uses, such as barbeques and patio heaters, account for the remaining natural gas consumption.

Exhibit 3.5: Base Year Residential Sector Natural Gas Use for the Total Enbridge Gas Service Area, by End Use



3.4 REFERENCE CASE

In the absence of new DSM initiatives, the study estimates that natural gas consumption in the Residential sector will grow from 4,442,437,000 $m^{3/}$yr in 2007 to about 4,772,205 $m^{3/}$yr in 2017. This represents an overall growth of about 7.4% in the period and compares very closely with Enbridge‘s own forecast, which also includes consideration of the impacts of “natural conservation.”

Exhibit 3.6 (overleaf) shows the forecast levels of Residential sector natural gas consumption for the entire Enbridge service area. The results are presented for each milestone year and end use.

Exhibit 3.6: Residential Sector Reference Case Natural Gas Use for the Total Enbridge Service Area, by Dwelling Type, End use and Milestone Year (1000 m^3/yr)

3.5 ASSESSMENT OF ENERGY EFFICIENCY MEASURES

The study assessed a total of approximately 50 potential energy efficiency measures. A summary of the screening results for the energy-efficiency measures is presented in Exhibit 3.7. Due to the number of measures assessed, Exhibit 3.7 shows only the results for those options that pass the screen in the Central service region.

Exhibit 3.7: Summary of Measure TRC Screening Results Residential Sector Energy-efficiency Options – Central Region

Measure	Measure Description	Full/Incr.	Simple Payback (Years)	Measure TRC ($)	Benefit/Cost Ratio

3.6 ECONOMIC POTENTIAL FORECAST

Under the conditions of the Economic Potential Forecast,[10] the study estimated that natural gas consumption in the Residential sector would decline to about 3,880 million $m^{3/}$yr by 2017 for the total Enbridge service area. Annual savings relative to the Reference Case are about 842 million $m^{3/}$yr by 2017, or about 18%. Further details are provided in Exhibits 3.8 and 3.9, which show the results for both milestone years by dwelling type and end use, respectively.

Exhibit 3.8: Natural Gas Savings for the Total Enbridge Service Area by Dwelling Type and Milestone Year, Reference Case vs. Economic Potential (1000 m^3/yr.)

Dwelling Type	Milestone Year		% Savings 2017	
	2012	2017	Re: Ref Case	Re: Total
	1000 m^3/yr.			
Detached - without gas space heat	7,861	9,463	29%	1%
Detached - pre-1980s	401,529	417,743	22%	50%

Duplex/Row/Multi - no space htg	989	1,521	23%	0%
Duplex/Row/Multi - pre-1980s	52,851	55,330	19%	7%
Duplex/Row/Multi - 1980 or newer	45,322	67,309	14%	8%
Other	28,303	36,159	10%	4%
Total	743,361	841,895	18%	100%

Note: Any difference in totals is due to rounding.

[10] The level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost-effective. In this study, "cost-effective" means that the technology upgrade passes the measure Total Resource Cost (TRC) test, as discussed previously in Section 1.4.

Exhibit 3.9: Natural Gas Savings for the Total Enbridge Service Area by End Use and Milestone Year, Reference Case vs. Economic Potential (1000 m^3/yr.)

End Use	Milestone Year		% Savings 2017	
	2012	2017	Re: Ref Case	Re: Total
	1000 m^3/yr.			
Space Heating	374,454	385,062	12%	46%
DHW	207,214	278,239	30%	33%
Fireplaces	5,413	9,805	5%	1%
Dryers	8,759	17,403	22%	2%
Pool Heaters	147,521	151,387	72%	18%
Total	743,361	841,895	18%	100%

Note: DHW savings include savings from reduced DHW consumption by efficient clothes washers and dishwashers. Any difference in totals is due to rounding.

3.6.1 Sensitivity Analysis

The Economic Potential results were subjected to a sensitivity analysis around two of the assumptions employed: Technology Cost and inclusion of a value for GHG emissions (as described in Step 5, in Section 1.4). The two sensitivity analyses offer the following insights:

- In the residential sector, there are a substantial number of measures that do not currently pass the economic screen but do offer substantial additional savings potential. Most of these measures provide improved thermal performance in existing dwellings.

  The Technology Cost sensitivity analysis identified potential savings of about 1,907 million m^3 in 2017; this compares with identified savings potential of about 734 million m^3 in 2017 under the Economic Potential forecast. Hence, the identified Technical savings potential is about a 2.6 times that identified in the Economic Potential forecast.

- The GHG adder makes a relatively small difference to the overall avoided cost of energy, and therefore, only a few additional measures pass the economic screen. Potential savings are increased by only a modest amount.

3.7 ACHIEVABLE POTENTIAL

As noted previously, Achievable Potential was assessed from two perspectives:

- Potential Savings in Future Natural Gas Consumption: Savings in one year due to the aggregate impact of measures implemented over the time period of Base Year (2007) to Milestone Year (2012 and 2017). This method calculates the net change in future natural gas supply requirements.

- Potential DSM Program TRC Benefits.[11] Savings due to (only) those measures implemented in one year. This method is used in calculation of the net TRC benefits.

Within each of the above perspectives, the analysis of Achievable Potential was assessed under four different Marketing scenarios:

- One Financially Unconstrained scenario
- Three Financially Constrained scenarios, each limited by a different level of program budget availability.

Further detail related to each of the Marketing scenarios is provided below followed by a summary of results.

3.7.1 Financially Unconstrained DSM Marketing Scenario

The Financially Unconstrained scenario provides an overview of the level of potential natural gas savings that could be achieved if a comprehensive portfolio of DSM programs was launched without any constraint on the availability of program funding, except for the requirement to maintain a positive TRC.

Although the results of this scenario are not constrained by program funding, the results do incorporate consideration of the market constraints identified during the Achievable Potential workshop, such as product and service availability and customer transaction costs.

This scenario, therefore, provides a high-level estimate of the upper level of natural gas savings that could be achieved by Enbridge's residential customers over the nine-year period beginning in 2009 and ending in 2017. It also provides Enbridge's residential DSM program personnel with a view of the relative potential contribution of individual sub sectors, end uses, technologies and service regions.

[11] The annual savings presented do not explicitly address the potential impact of free riders at the level of individual program measure. However, the Reference Case 3 does include an estimate of the impact of natural conservation over the study period, by end use (i.e., an estimate of natural gas savings that would occur in the absence of additional Enbridge DSM programs). Hence, the inclusion of natural conservation in the study's Reference Case does address some, but not necessarily all, free rider and spillover impacts. A more detailed assessment of free rider and spillover impacts is practical only as part of a detailed program design, which is beyond the scope of this study.

Major Assumptions: Financially Unconstrained Scenario

- All measures that pass the measure TRC screen are included
- No program financial limit is set, except that all measures must continue to pass the measure TRC screen
- Participation rates for each measure are based on the workshop results, which consider both market barriers and potential promotional strategies.

Exhibit 3.10 provides details on the program costs assumed for each measure.

Exhibit 3.10: Summary of Program Cost Assumptions, Financially Unconstrained Scenario[12]

Upgrade Technology/Measures	Fixed Program Costs ($/yr.)	Measure Basis	Measure Cost ($)[A]	Incentive Level (% of cost)	Payback After Incentive (yrs.)

[A] Where measure cost varies by region and/or housing type, the cost for existing single detached homes in the Central service region is shown

3.7.2 Financially Constrained DSM Marketing Scenarios

These DSM scenarios provide estimates of the potential impacts of increasingly larger annual DSM budgets that, as noted previously, were set at $20, $40 and $60 million annually. Within each of these budgets, 50% of the funding is allocated to the Residential sector for the purposes of this analysis; thus, the annual Residential sector budgets are $10, $20 and $30 million annually.

The Financially Constrained scenarios include the following DSM costs:

[12] Salary and related overhead costs are not included in program cost estimates. Also, the incentive levels are capped at 100% of the indicated measure cost.

- **Fixed Program Costs:** This includes costs for items such as newspaper advertisement, preparation of information and marketing materials, training workshops, contractor certifications, etc. These are program cost elements that would not be expected to vary significantly if the number of installations of the measure changed. Estimates for these cost items were provided by Enbridge personnel based on current and previous experience with similar DSM measures. In each case, these costs are expressed as dollars of program spending per year. Salary and related overhead costs are not included.

- **Incentive Costs:** These costs would include any costs that vary directly according to the number of installations of the measure. In each case, these costs are expressed as a percentage of the installed cost of the measure.

Exhibit 3.11 provides details on the program costs assumed for each measure.

Exhibit 3.11: Summary of Program Cost Assumptions, Financially Constrained Scenarios[13]

Upgrade Technology/Measures	Fixed Program Costs ($/yr.)	Measure Basis	Measure Cost ($)[A]	Incentive Level (% of cost)	Payback After Incentive (yrs.)
High-Performance Windows	25,000	Incr.	500	100%	0.0

[A] Where measure cost varies by region and/or housing type, the cost for existing single detached homes in the Central service region is shown

[13] Salary and related overhead costs are not included in program cost estimates. Also, the incentive levels are capped at 100% of the indicated measure cost.

3.7.3 Achievable Potential Savings - Future Natural Gas Consumption[14]

Exhibits 3.12 to 3.14, inclusive, present a summary of the Achievable Potential savings in future natural gas consumption relative to the Reference Case levels. For illustration, the results of the Financially Unconstrained scenario are shown. Selected highlights are provided below.

- Exhibit 3.12 shows that total Residential sector natural gas savings in 2017 are estimated to be approximately 355 million m^3/yr. This represents a savings of approximately 8%, relative to the Reference Case and is equal to approximately 42% of the savings identified in the Economic Potential Forecast. The Central service region accounts for about 83% of the identified potential. In this scenario, the rate of introduction of full cost measures is limited by market constraints; as a result the potential savings in 2012 were estimated to be approximately 172 million m^3/yr., or about 23% of the savings identified in the Economic Potential Forecast, where full cost measures are introduced immediately.

- Exhibit 3.13 shows the results by dwelling type. As illustrated, single-family detached dwellings account for nearly 80% of the identified potential and over 60% of these potential savings are in dwellings built prior to 1980.

- Exhibit 3.14 shows the results by end use. As illustrated, measures that reduce space heating and domestic hot water loads account for approximately 87% of the identified potential, followed by pool heaters (10%), fireplaces (1%) and clothes dryers (1%). Additional detail on the specific measures that contribute to these end-use savings is provided in the following sections.

Exhibit 3.12: Natural Gas Savings by Service Region and Milestone Year, Financially Unconstrained Scenario (1000 m^3/yr.)

Milestone Year	Central Region	Eastern Region	Total	% Savings Relative to Ref Case
	1000 m^3/yr.			
2012	139,540	32,190	171,730	4%

Note: DHW savings include savings from reduced DHW consumption by efficient clothes washers and dishwashers. Any difference in totals is due to rounding.

3.7.4 Potential DSM Program TRC Benefits

Exhibits 3:15, 3.16 and 3.17 present the results for the milestone year 2017. As illustrated, annual Residential sector program spending of approximately $10 million in 2017 would result in the installation of measures providing approximately 21 million m^3/year in natural gas savings[15] and approximately $46 million in TRC net benefits. The exhibits also illustrate that even under the conditions defined by the Financially Unconstrained scenario, the Residential sector runs out of eligible cost-effective measures. Additional details are provided in the following exhibits.

- Exhibit 3.15 presents the 2017 results by upgrade technology or measure, including both the Current Marketing Level of customer participation and the increment from the Current Marketing Level to the Financially Unconstrained Marketing scenario. For each measure, annual natural gas savings potential, net TRC benefits and annual program costs are presented both individually and cumulatively. The measures are sorted in order of increasing program cost per dollar of TRC benefits. The 10

15 Note: the savings shown are only for the measures installed in 2017; they do not include the savings in 2017 that occur as a result of measures installed in prior periods.

measures contributing the most TRC benefits are assigned letters, matching the labels on Exhibits 3.14 and 3.15.

- Exhibit 3.16 presents the 2017 results graphically, with program costs on the vertical axis and net TRC benefits on the horizontal axis. All of the measures that pass the measure TRC screen are included here but balloons are added to indicate the location of the top ten measures (in terms of TRC benefits) on the curve. Three annual budget levels for residential program spending are shown as horizontal lines, for reference.

- Exhibit 3.17 presents the 2017 results graphically, with program costs on the vertical axis and annual natural gas savings potential on the horizontal axis. As with Exhibit 3.16, all of the measures which are included in the Achievable Potential analysis are shown here and balloons are added to indicate the positions of substantial measures on the curve. Sorting of the measures is based on program costs per unit TRC benefit.

Exhibit 3.15: Summary of 2017 Achievable Results** by Measure, for the Total Enbridge Service Area

Exhibit 3.16: Achievable Potential Supply Curve, 2017: Program Cost vs. TRC Net Benefits, for the Total Enbridge Service Area

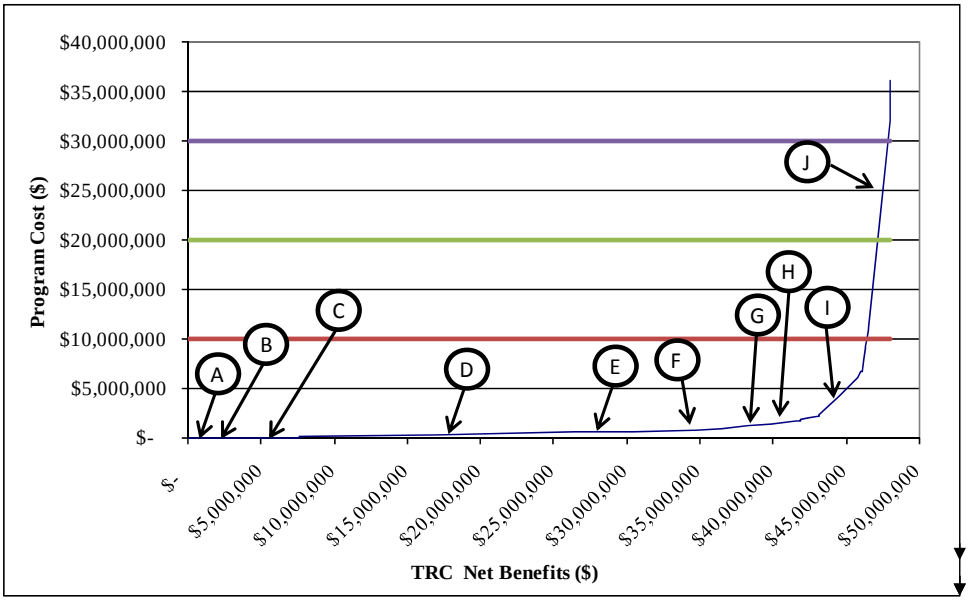

Exhibit 3.17: Achievable Potential Supply Curve, 2017: Program Cost vs. Annual Gross Natural Gas Savings Potential, for the Total Enbridge Service Area

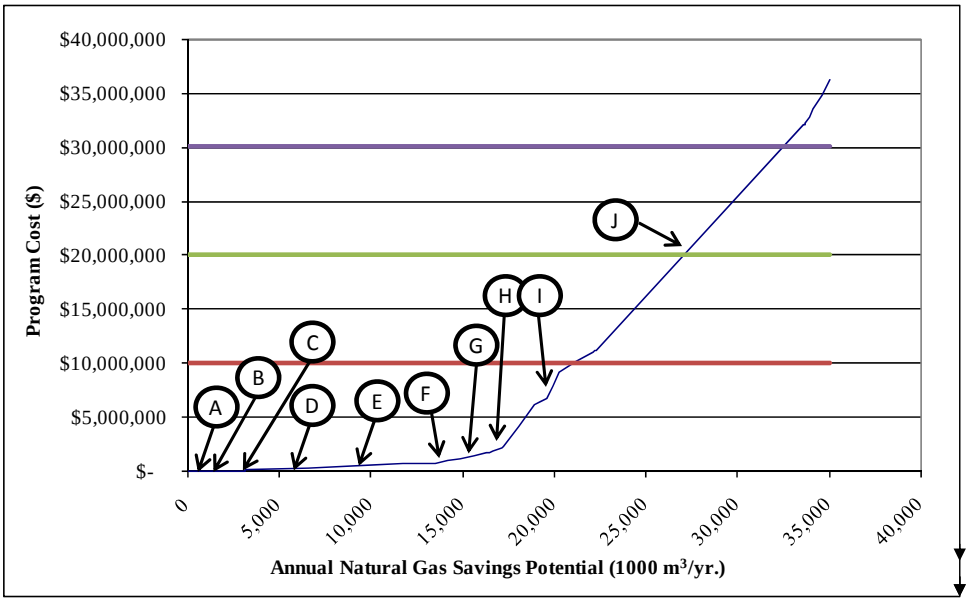

3.7.5 Conclusions

Selected highlights are provided below.

- Program costs per dollar of TRC net benefits increase over the study period to 2017. This is because the measures with low installed cost are assumed to follow a more rapid adoption curve (Curve C, as described in the workshop), leaving more expensive measures to dominate the mixture in later years of the program.

- The supply curves show a sharp increase in program costs associated with capturing additional savings past an annual program spending of level of approximately $10 million on residential DSM.

- With residential program spending of approximately $10M in 2017, program costs are approximately $0.47 per gross m^3 of natural gas savings and $0.22 per dollar of gross TRC benefits. If residential program spending increases to $20M in the same year, program costs increase substantially to approximately $0.74 per gross m^3 of natural gas savings and $0.42 per dollar of gross TRC benefits. This compares with recent Enbridge monitoring and evaluation results[16] of $0.32 m^3 of gross natural gas savings ($0.51 per m^3 of net savings).

- The measures that provide the most significant contribution to annual savings differ somewhat by milestone year. Measures that offer particularly significant natural gas savings potential in both milestone years include air sealing in older homes, programmable thermostats, and high-performance windows. Measures such as ultra low-flow showerheads provide large savings in 2012 but not in 2017 as they are assumed to have fully penetrated the market by 2017.

- Although the weighted average program costs associated with each of the financially constrained scenarios will vary depending on the specific composition of future program portfolios[17], there is an evident trend towards higher future program costs to achieve natural gas savings and TRC benefits. This trend recognizes that savings from DSM programs tend to become more expensive with time as the most attractive measures gain greater market penetration and new performance standards are introduced, which leaves the more challenging measures.

[16] Enbridge, 2007 LRAM Post Audit Results.

[17] Design of a DSM program portfolio is beyond the scope of this current study.

3.8 ADDITIONAL OBSERVATIONS

Two additional observations warrant note as they may affect future residential program strategies. They include:

- ***Niche Markets Warrant Greater Program Focus:*** As the DSM market matures within Enbridge's service area, niche or target markets are becoming increasingly important. For example, measures that may not pass the TRC test in a "typical" or "average" application often will pass in niche applications. Air sealing and insulation in older homes (built before 1980) is one example that was included in this study, as data were available. Similarly, additional domestic hot water measures may be feasible in homes with a larger number of occupants. For example, drain water heat recovery systems and DHW recirculation systems become more economically attractive with larger household sizes. These latter measures have not been included in the current results as suitable data were not available.

- ***Market Transformation Approaches Warrant Additional Consideration***: The technology cost sensitivity analysis showed that there remains an additional untapped potential savings by 2017 of about 1,100 million m^3 from technically mature measures that do not currently pass the TRC screen. The largest share of these additional potential savings is from air sealing and envelope insulation in existing homes. These measures do not pass the TRC screen as currently defined. However, they provide non-energy benefits such as increased comfort and reduced noise that are not currently captured in the TRC calculation. Similarly, industry specialists emphasized that as insulation levels increase, proper air and moisture sealing is becoming increasingly essential to the long-term structural integrity of Ontario's housing stock. This situation presents both an opportunity and a possible technical issue that may be better addressed through a market transformation approach.

4. COMMERCIAL SECTOR

The Commercial sector includes office and retail buildings, hotels and motels, restaurants, warehouses and a wide variety of small buildings. In this study, it also includes buildings that are often classified as "institutional," such as hospitals and nursing homes, schools and universities.

Throughout this report, use of the word "commercial" includes both commercial and institutional buildings unless otherwise noted.

4.1 APPROACH

The detailed end-use analysis of energy efficiency opportunities in the Commercial sector employed two linked modelling platforms: **CEEAM** (Commercial Energy and Emissions Analysis Model), a Marbek in-house simulation model developed in conjunction with Natural Resources Canada (NRCan) for modelling natural gas use in commercial/institutional building stock, and **CSEEM** (Commercial Sector Energy End-use Model), an in-house spreadsheet-based macro model.

The major steps in the general approach to the study were outlined earlier in Section 1.4 (Approach). Specific procedures for the Commercial sector were as follows:

- **Modelling of Base Year –** Marbek compiled data that defines "where" and "how" natural gas is currently used in existing commercial buildings. The consultants then created building energy use simulations for each type of commercial building and calibrated the models to reflect actual Enbridge customer sales data. Estimated savings for the Other Commercial Buildings category were derived from the results of the modelled segments. They did not directly model that category because it is extremely diverse and the natural gas use of individual facility types is relatively small. The consultant's model produced a close match with actual Enbridge sales data.

- **Reference Case Calculations –** For the Commercial sector, Marbek developed detailed profiles of new buildings in each of the building segments, estimated the growth in building stock and estimated "natural" changes affecting Natural gas consumption over the study period. As with the Base Year calibration, the consultant's projection closely matches the Enbridge 2007 forecast of future natural gas requirements.

- **Assessment of DSM Measures** - To estimate the economic and achievable natural gas savings potentials, the consultants assessed a wide range of commercially available DSM measures and technologies such as:

    - Measures to improve building envelope efficiency
    - Measures to reduce domestic hot water use, including solar hot water systems
    - Upgraded heating and ventilating systems
    - Improved construction in new buildings
    - Efficient cooking appliances.

4.2 COMMERCIAL NATURAL GAS SAVINGS POTENTIAL

A summary of the levels of annual natural gas consumption and potential natural gas savings contained in each of the Commercial sector forecasts addressed by the study are presented in Exhibits 4.1 to 4.3 and discussed briefly in the sub sections that follow.

Exhibit 4.1: Graphic of Forecast Results for the Enbridge Service Area – Annual Natural Gas Consumption, Commercial Sector (million m^3/yr)

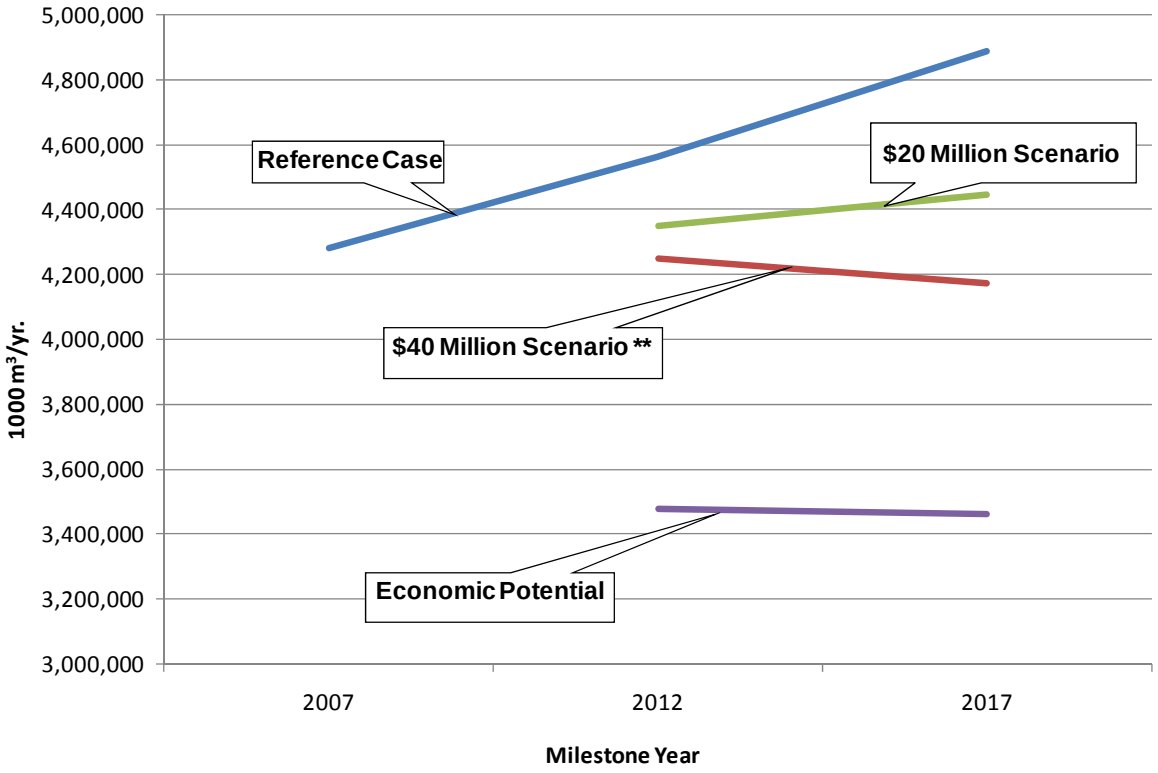

Exhibit 4.2: Summary of Forecast Results for the Total Enbridge Service Area - Annual Natural Gas Consumption, Commercial Sector (million m^3/yr)

Milestone Year	Annual Consumption in Commercial Sector (million m^3/yr.)					
	Reference Case	Economic Potential	Achievable Potential			
			$20M Scenario	$40M Scenario*	$60M Scenario	Financially Unconstrained
2007	4,281					
2012	4,561	3,479	4,350	4,251	**	4,251
2017	4,888	3,461	4,447	4,172	**	4,172

Note: Estimated annual program costs for implementing all cost-effective Commercial sector measures is $10.9 million, moderately less than the $12 million allocated to the commercial sector in the $40 million DSM scenario. Based on the Achievable workshop results, no additional savings were identified in the $60 million or Financially Unconstrained scenarios, while maintaining a positive TRC.

Exhibit 4.3: Summary of Forecast Results for the Total Enbridge Service Area – Achievable Natural Gas Savings in Milestone Years, Commercial Sector (million m^3/yr. and % Relative to Economic Potential Scenario)

Milestone Year	Natural Gas Savings (million m^3/yr., % Relative to Economic Potential)				
	Economic Potential	Achievable Potential			
		$20M Scenario	$40M Scenario*	$60M Scenario	Financially Unconstrained
2012	1,082	212	310	**	310
2017	1,427	440	715	**	715
2012		20%	29%	**	29%
2017		31%	50%	**	50%

Note**:** Natural gas savings in the milestone years represent the potential reduction in gas use in that year as a result of DSM measures implemented in the period. Based on the Achievable workshop results, no additional savings were identified in the $60 million or Financially Unconstrained scenarios, while maintaining a positive TRC.

4.3 BASE YEAR NATURAL GAS USE

In the Base Year of 2007, the Commercial sector in Enbridge's total service area consumed about 4,200,439,000 m^3. The Central service region accounts for approximately 78% of the total commercial sector sales shown in Exhibit 4.4; the Eastern service region accounts for the remaining 22%.

Among the modelled sub sectors shown in Exhibit 4.4, high-rise apartments, mid-rise apartments and large offices are the three largest natural gas users.

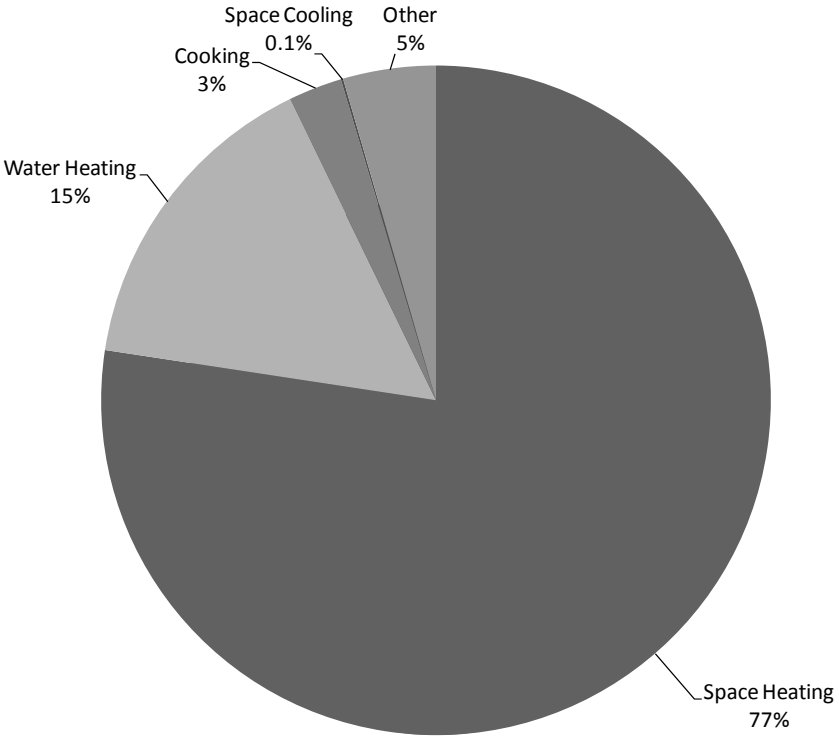
The Other Commercial Buildings sub sector, which is also a large natural gas user, includes buildings that do not fit into any of the remaining sub sectors listed in Exhibit 4.4. These include buildings used for recreational purposes, religious buildings, laundromats, gas stations/car washes, institutional buildings such as correctional facilities, and numerous other building types. Finally, the "Other" sub sector shown in Exhibit 4.4 includes Enbridge customer accounts with missing or unsubstantiated Standard Industrial Classification (SIC) code data. These accounts are classified as "not found" or are unlabelled in the Enbridge sales database.

Exhibit 4.4: Base Year Commercial Sector Natural Gas Use for the Total Enbridge Service Area (1000 m^3/yr)

Sub Sector	Space Heating	Water Heating	Cooking	Space Cooling	Other	Total
Large Office	326,437	34,368	1,431	1,695	53,675	417,606
Small Office	203,775	16,956	691	0	10,360	231,782
Strip Mall	122,794	11,696	5,322	0	6,652	146,464
Retail Services	133,496	8,610	4,366	0	5,458	151,930
Food Retail	62,786	6,173	4,151	0	865	73,975
Large Hotel	20,296	11,489	2,246	232	2,215	36,478
Hotel/Motel	4,239	3,638	97	0	730	8,705
Hospital	78,360	14,835	1,844	503	7,674	103,217
Nursing Home	26,511	8,913	1,993	0	2,835	40,252
School	115,427	7,666	1,789	0	844	125,725
University/College	111,654	15,488	3,742	973	7,128	138,985
Restaurant/Tavern	69,334	27,949	46,130	0	582	143,996
Warehouse/Wholesale	248,854	12,254	510	0	10,195	271,813
Highrise Apartment	578,820	195,990	2,575	0	20,597	797,981
Midrise Apartment	214,163	85,405	844	0	4,222	304,634
Other Commercial Buildings						250,838
Other						956,055
Total	2,316,948	461,429	77,731	3,403	134,034	4,200,439

Exhibit 4.5 shows that space heating accounts for about 77% of total commercial sector natural gas use. Domestic hot water (DHW) accounts for about 15% of the total natural gas use, followed by cooking (3%). A variety of other miscellaneous end uses accounts for the remaining natural gas consumption.

Exhibit 4.5: Base Year Commercial Sector Natural Gas Use for the Total Enbridge Service Area, by End Use[18]



4.4 REFERENCE CASE

In the absence of new DSM initiatives, the study estimates that natural gas consumption in the Commercial sector will grow from 4,200,439,000 $m^{3/}$yr in 2007 to about 4,795,278,000 $m^{3/}$yr in 2017. This represents an overall growth of about 14.2 % in the period and compares very closely with Enbridge‘s own forecast, which also includes consideration of the impacts of “natural conservation.”

Exhibit 4.6 (overleaf) shows the forecast levels of Commercial sector natural gas consumption for the entire Enbridge service area. The results are presented for each milestone year and end use.

[18] The pie chart in Exhibit 4.5 presents percentage of gas consumption by end use for modelled buildings only; the sub sectors “Other Commercial Buildings” and “Other” are included in the total load of the preceding Exhibits, but not included in the pie chart.

Exhibit 4.6: Commercial Sector Reference Case Natural Gas Use for the Total Enbridge Service Area, by Building Type, End use and Milestone Year (1000m^3/yr)

4.6 ECONOMIC POTENTIAL FORECAST

Under the conditions of the Economic Potential Forecast,[19] the study estimated that natural gas consumption in the Commercial sector would decline to about 3,461,000,000 $m^{3/}$yr by 2017 for the total Enbridge service area. Annual savings relative to the Reference Case are about 1,427,000,000 $m^{3/}$yr by 2017, or about 29%. Further details are provided in Exhibit 4.8, which show the results for both milestone years by sub sector and end use.

4.6.1 Sensitivity Analysis

The Economic Potential results were subjected to a sensitivity analysis around two of the assumptions employed: Technology Cost and inclusion of a value for GHG emissions (as described in Step 5, in Section 1.4). The two sensitivity analyses offer the following insights:

- In the commercial sector, there are relatively few measures that do not pass the economic screen (10 of a total of 40 evaluated measures). Moreover, the additional 10 measures included in the Technology Cost sensitivity analysis provide only modest additional savings relative to the technologies already included in the Economic Potential Forecast.

- The Technology Cost sensitivity analysis identified potential savings of about 1,680 million m^3 in 2017; this compares with identified savings potential of about 1,399 million m^3 in 2017 under the Economic Potential forecast. Hence, the identified Technical savings potential is about 20% greater than that identified in the Economic Potential forecast.

- The GHG adder makes a relatively small difference to the overall avoided cost of energy, and therefore, only one additional measure passes the economic screen. Potential savings are increased by about 2%.

[19] The level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost-effective. In this study, "cost-effective" means that the technology upgrade passes the measure Total Resource Cost (TRC) test

4.7 ACHIEVABLE POTENTIAL

As noted previously, Achievable Potential was assessed from two perspectives: [20]

- Potential Savings in Future Natural Gas Consumption: Savings in one year due to the Aggregate impact of measures implemented over the time period of Base Year (2007) to Milestone Year (2012 and 2017). This method calculates the net change in future natural gas supply requirements.

- Potential DSM Program TRC Benefits. [21] Savings due to (only) those measures implemented in one year. This method is used in calculation of the net TRC benefits.

Within each of the above perspectives, the analysis of Achievable Potential was assessed under four different Marketing scenarios:

- One Financially Unconstrained scenario
- Three Financially Constrained scenarios, each limited by a different level of program budget availability.

Further detail related to each of the Marketing scenarios is provided below followed by a summary of results.

4.7.1 Financially Unconstrained DSM Marketing Scenario

The Financially Unconstrained scenario provides an overview of the level of potential natural gas savings that could be achieved if a comprehensive portfolio of DSM programs was launched without any constraint on the availability of program funding, except for the requirement to maintain a positive TRC.

Although the results of this scenario are not constrained by program funding, the results do incorporate consideration of the market constraints identified during the Achievable Potential workshop, such as product and service availability and customer transaction costs.

This scenario, therefore, provides a high-level estimate of the upper level of natural gas savings that could be achieved by Enbridge's commercial customers over the nine-year period beginning in 2009 and ending in 2017. It also provides Enbridge's DSM program personnel with a view of the relative potential contribution of individual sub sectors, end uses, technologies and service regions.

[20] See definition of savings as provided in Step 6, page 7.

[21] The annual savings presented do not explicitly address the potential impact of free riders at the level of individual program measure. However, the Reference Case 3 does include an estimate of the impact of natural conservation over the study period, by end use (i.e., an estimate of natural gas savings that would occur in the absence of additional Enbridge DSM programs). Hence, the inclusion of natural conservation in the study's Reference Case does address some, but not necessarily all, free rider and spillover impacts. A more detailed assessment of free rider and spillover impacts is practical only as part of a detailed program design, which is beyond the scope of this study.

Major Assumptions: Financially Unconstrained Scenario

- All measures that pass the measure TRC screen are included
- No program financial limit is set, except that all measures must continue to pass the measure TRC screen
- Participation rates for each measure are based on the workshop results, which consider both market barriers and potential promotional strategies.

Exhibit 4.9 provides details on the program costs assumed for each measure.

Exhibit 4.9: Summary of Program Cost Assumptions, Financially Unconstrained Scenario[22]

Measure Name	Fixed Program Costs per bundle ($/yr.)	Incentive Amount ($/m^3 saved)	Simple Payback After Incentive (yrs.)
High-Performance Glazings	$ 75,000	$ 0.332	4.6
Roof insulation		$ 0.332	6.4
Air Curtains	$ 14,000	$ 0.277	0.9
Condensing Boiler - Baseline: Standard Boiler	$ 60,000	$ 0.221	4.5
Condensing Boiler - Baseline: Near Condensing		$ 0.221	7.1
Near-Condensing Boiler		$ 0.221	1.3
Condensing Unit Heater	$ 60,000	$ 0.332	1.6
High-Efficiency Rooftop Unit		$ 0.277	1.5
Condensing Furnace		$ 0.221	1.9
Demand Controlled Ventilation	$ 70,000	$ 0.332	0.8
Demand Control Kitchen Ventilation		$ 0.508	1.1
Heat Recovery		$ 0.332	2.5
Condensing Water Heater	$ 40,000	$ 0.332	3.3
Condensing Storage Water Heater		$ 0.332	2.4
Low-Flow Faucet Aerators	$ 2,500	$ 0.042	0.4
Low-Flow Showerheads		$ 0.042	0.3
Pre-Rinse Spray Valve	$ 40,000	$ 0.300	0.1
High-Efficiency Broiler	$ 40,000	$ 0.332	-0.2
ENERGY STAR® Fryer		$ 0.332	3.0
High-Efficiency Range		$ 0.332	1.7
Building Recommissioning	$ 600,000	$ 0.249	0.6
Advanced Building Automation Systems		$ 0.249	2.7
Steam Plant Efficiency Measures		$ 0.249	0.7
HVLS Destratification Fans	$ 20,000	$ 0.332	2.7
New Construction - 25% More Efficient	$ 735,000	$ 0.159	3.8
New Construction - 40% More Efficient		$ 0.159	3.9

[22] Salary and related overhead costs are not included in program cost estimates. Also, the incentive levels are capped at 100% of the indicated measure cost.

4.7.2 Financially Constrained DSM Marketing Scenarios

These DSM scenarios provide estimates of the potential impacts of increasingly larger annual DSM budgets, which as noted previously were set at $20, $40 and $60 million, annually. Within each of these budgets, 30% of the funding is allocated to the Commercial sector for the purposes of this analysis.

The financially constrained scenarios include the following DSM costs:

- **Fixed Program Costs**: This includes costs for items such as newspaper advertisements, preparation of information and marketing materials, training workshops, contractor certifications, etc. These program cost elements are not expected to vary significantly if the number of installations of the measure changed. Estimates for these cost items were provided by Enbridge personnel, based on current and previous experience with similar DSM measures. In each case, these costs are expressed as dollars of program spending per year. For each of the measures, fixed program costs were estimated for both the CML and Financially Unconstrained Marketing scenarios. Salary and related overhead costs are not included.

- **Incentive Costs**: These costs would include any costs that vary directly according to the number of installations of the measure. Incentive amounts vary by measure and are expressed as dollars per m^3 gas saved.

Exhibit 4.10 provides details on the program costs assumed for each measure.

Exhibit 4.10: Summary of Program Cost Assumptions, CML Scenario[23]

Measure Name	Fixed Program Costs per bundle ($/yr.)	Incentive Amount ($/m^3 saved)	Simple Payback After Incentive (yrs.)
High-Performance Glazings	$ 50,000	$ 0.100	5.1
Roof Insulation		$ 0.100	6.9
Air Curtains	$ 7,000	$ 0.100	1.0
Condensing Boiler - Baseline: Standard Boiler	$ 40,000	$ 0.100	4.7
Condensing Boiler - Baseline: Near Condensing		$ 0.100	7.3
Near-Condensing Boiler		$ 0.100	1.6
Condensing Unit Heater	$ 40,000	$ 0.100	2.1
High-Efficiency Rooftop Unit		$ 0.100	1.9
Condensing Furnace		$ 0.100	2.2
Demand Controlled Ventilation	$ 35,000	$ 0.100	1.3
Demand Control Kitchen Ventilation		$ 0.152	1.6
Heat Recovery		$ 0.100	3.0
Condensing Water Heater	$ 20,000	$ 0.100	3.7
Condensing Storage Water Heater		$ 0.100	2.9
Low-Flow Faucet Aerators	$ 1,000	$ 0.025	0.4
Low-Flow Showerheads		$ 0.025	0.3
Pre-Rinse Spray Valve	$ 20,000	$ 0.120	0.2
High-Efficiency Broiler	$ 20,000	$ 0.100	0.3
ENERGY STAR® Fryer		$ 0.100	3.5
High-Efficiency Range		$ 0.100	2.1
Building Recommissioning	$ 400,000	$ 0.100	0.7
Advanced Building Automation Systems		$ 0.100	2.8
Steam Plant Efficiency Measures		$ 0.100	1.0
HVLS Destratification Fans	$ 10,000	$ 0.100	3.2
New Construction - 25% More Efficient	$ 490,000	$ 0.064	3.8
New Construction - 40% More Efficient		$ 0.064	3.9

[23] Salary and related overhead costs are not included in program cost estimates. Also, the incentive levels are capped at 100% of the indicated measure cost.

4.7.3 Achievable Potential Savings – Future Natural Gas Consumption

Exhibits 4.11 and 4.12 present a summary of the Achievable Potential savings in future natural gas consumption relative to the Reference Case levels. For illustration, the results of the Financially Unconstrained scenario are shown. Selected highlights are provided below.

- Exhibit 4.11 shows that total Commercial sector natural gas savings in 2017 are estimated to be approximately 715 million m^3/yr. This represents a savings of approximately 15%, relative to the Reference Case and is equal to approximately 50% of the savings identified in the Economic Potential Forecast. The Central service region accounts for about 81% of the identified potential.

- Exhibit 4.12 shows the results by sub sector and end use for the Enbridge Service Area. As illustrated, the majority of savings are associated with the space heating end use (74%), while three sub sectors (High-rise Apartment, Other Buildings and Large Office) account for nearly 50% of total savings under this scenario.

Exhibit 4.11: Natural Gas Savings by Service Region and Milestone Year, Financially Unconstrained Scenario (1000 m^3/yr.)

Milestone Year	Central service region	Eastern service region	Total	% Savings Relative to Ref Case
	(1000 m^3/yr.)			
2012	251,047	59,149	310,196	7%

4.7.4 Potential DSM Program TRC Benefits

Exhibits 4.13, 4.14 and 4.15 present the results for the milestone year 2017. As illustrated, annual Commercial sector program spending of approximately $10.4 million in 2017 is estimated to result in the installation of measures providing approximately 67 million m^3/year in natural gas savings[24] and approximately $203 million in TRC net benefits. The exhibits also show that annual commercial program spending achieves maximum results at expenditures of $10.4 million in 2012 and $10.9 million in 2017, which is below the allowable Commercial sector program budget of $12 million. This is because additional cost-effective measures were not available while also maintaining a positive TRC. Additional details are provided in the following exhibits.

- Exhibit 4.13 presents the 2017 results by upgrade technology bundle, including both the current marketing level of participation and the increment from CML to financially unconstrained. For each measure bundle, annual natural gas savings potential, net TRC benefits and annual program costs are presented both individually and cumulatively. The measures are sorted in order of increasing program cost per dollar of TRC benefits. The six measure bundles contributing the most TRC benefits are assigned letters, matching the labels on Exhibits 4.13 and 4.14.

- Exhibit 4.14 presents the 2017 results graphically, with program costs on the vertical axis and net TRC benefits on the horizontal axis. The $6 million annual budget level for commercial program spending is shown as a horizontal line for reference.

- Exhibit 4.15 presents the 2017 results graphically, with program costs on the vertical axis and annual natural gas savings potential on the horizontal axis. The $6 million annual budget level for commercial program spending is shown as a horizontal line for reference.

[24] Note: the savings shown are only for the measures installed in 2017; they do not include the savings in 2017 that occur as a result of measures installed in prior periods.

Exhibit 4.13: Summary Achievable Results** by Measure, for the Enbridge Service Area, 2017 Installations

Exhibit 4.14: Achievable Potential Supply Curve, 2017 Installations: Program Cost vs. TRC Net Benefits, for the Enbridge Service Area

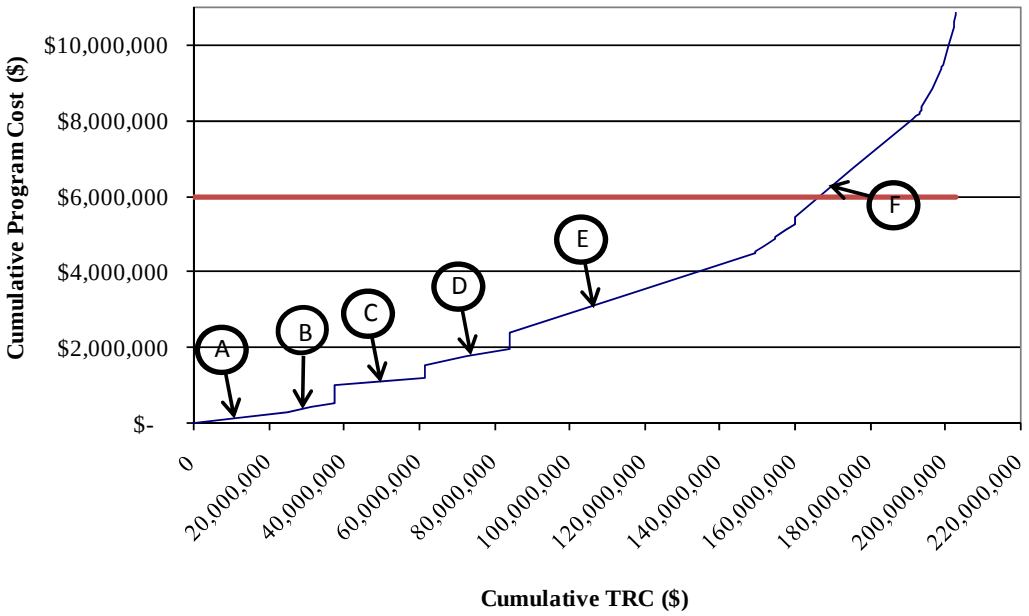

Exhibit 4.15: Achievable Potential Supply Curve, 2017 Installations: Program Cost vs. Annual Natural Gas Savings Potential, for the Enbridge Service Area

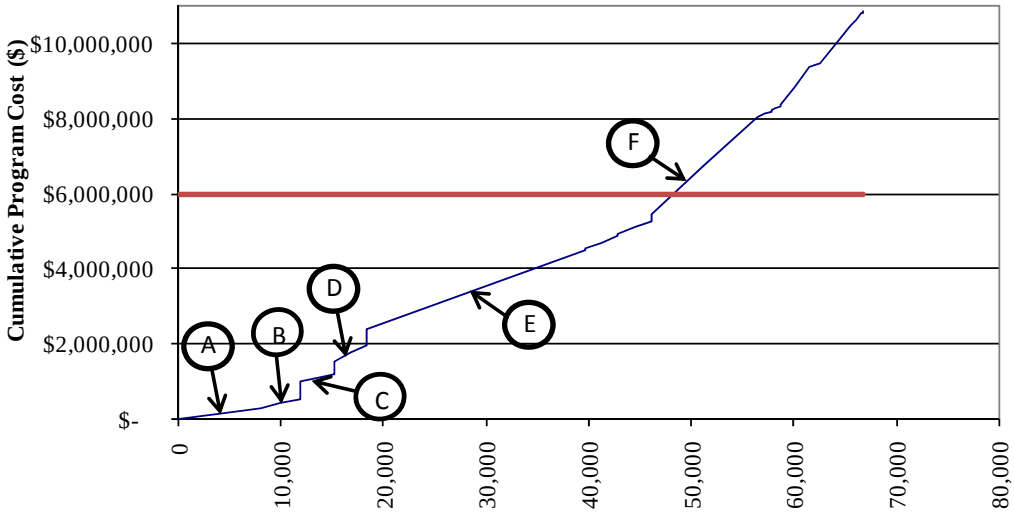

4.7.5 Conclusions

Selected highlights are provided below.

- Annual commercial program spending achieves maximum results at expenditures of $10.4 million in 2012 and $10.9 million in 2017, which is below the allowable commercial budget of $12 million. This is because additional cost-effective measures were not available under the conditions defined by this scenario.

- Program costs per dollar of TRC net benefits increase over the study period. This is primarily due to the fact that recommissioning, the largest commercial opportunity, is slightly more expensive on a cost per TRC dollar basis in 2017 than 2012. This reflects a situation in which fixed costs remain constant through time, while yearly savings levels decrease as the most attractive opportunities are realized by the earlier milestone year.

- With commercial program spending of approximately $10.4 million in 2017, program costs are approximately $0.16 per m^3 of natural gas savings and $0.05 per dollar of TRC benefits. This compares with recent Enbridge monitoring and evaluation results[25] of $0.11 per m^3 of gross natural gas savings ($0.14 m^3 net of free riders) in 2007.

- For two measure groups (space heating equipment and water heating equipment), savings for the year 2017 are greater under the Financially Constrained scenarios than under the Financially Unconstrained scenario. This reflects a situation in which the majority of the opportunity is realized in early years under the Financially Unconstrained scenario, while savings "ramp up" slowly under the Financially Constrained scenarios.

- Recommissioning represents the largest contribution to annual savings in both milestone years. Other measures that offer particularly significant natural gas savings potential in both milestone years include hot water conservation measures and efficient new construction.

[25] Enbridge Gas, 2007 LRAM Post Audit Results.

4.8 ADDITIONAL OBSERVATIONS

In addition to the preceding conclusions, three additional observations warrant note as they may affect future Commercial sector program strategies. They include:

- ***Rate of measure implementation has a large effect on overall savings:*** For measures that pass the TRC screen on an incremental cost basis, low participation rates in early milestone years create a significant "lost opportunity." This is particularly relevant to the replacement of equipment with a very long life (i.e. space heating equipment), building renovations such as envelope improvements, and new building construction. The gap between Economic Potential and Achievable Potential savings presented in this study is due in large part to this significant lost opportunity that occurs in early milestone years.

- ***Savings arising from full cost measures may be delayed without eroding overall potential:*** This is a corollary of the above point, and most pertinent to the discussion of the largest opportunity identified in this study, recommissioning. As recommissioning passes the TRC screen at full cost, eligible buildings which are not recommissioned remains as future opportunities, while incremental cost opportunities which are not exploited represent lost opportunities. This may be especially relevant to programming strategy during periods of economic downturn, when building owners and managers may be less likely to implement measures despite an attractive payback.

- ***Market transformation approaches warrant additional consideration:*** The technology cost sensitivity analysis showed that there remains an additional untapped potential savings by 2017 of about 269 million m^3 from technically mature measures that do not currently pass the TRC screen. The largest share of these additional potential savings are from air sealing and envelope upgrades, including wall insulation and more energy efficient glazing measures in existing buildings. These measures do not pass the TRC screen as currently defined. However, they provide non-energy benefits such as increased comfort and reduced noise that are not currently captured in the TRC calculation. In addition, industry specialists emphasized that some emerging technologies, such as solar preheated make-up air may be better addressed in a market transformation context, as they provide "soft" benefits, such as visible contribution to corporate greening goals, that are not included in the TRC calculation.

5. INDUSTRIAL SECTOR

The Industrial sector consists of the seven largest natural gas consuming industries within the Enbridge service area plus an additional miscellaneous category that combines eight smaller industry groups. The seven large industries, which are the primary focus of this study, are: Non-metallic Mineral Products, Food Products, Paper Manufacturing, Refined Petroleum and Coal, Chemical Manufacturing, Primary Metals and Fabricated Metals.

5.1 APPROACH

The detailed end-use analysis of energy efficiency opportunities in the Industrial sector employed Marbek's customized macro model. The model is organized by major industrial sub sector and major end use.

Natural gas end-use profiles were developed for the seven sub sectors described above. The profiles map proportionally how much natural gas is used by each of the end uses for each sub sector. These profiles represent the sub sector archetypes and are used in the model to calculate the natural gas used by each end use for each sub sector.

The major steps in the general approach to the study are outlined in Section 1.4 above (Approach). Specific procedures for the Industrial sector were as follows:

- **Modelling of Base Year –** The consultants compiled Base Year data on the industrial sector from a variety of sources, including Enbridge's customer information, the study team's own energy assessment experience within many of the sub sectors and secondary data sources. The macro model results produced a close match with actual Enbridge sales data.

- **Reference Case Calculations -** The consultants prepared a Reference Case forecast based on projected growth forecasts provided by Enbridge, which includes anticipated closing of existing facilities and opening of new facilities.

- **Assessment of DSM Measures** –To estimate the economic and achievable natural gas savings potentials, the consultants assessed a wide range of commercially available energy efficiency measures and technologies such as:

    - Integrated control systems
    - More efficient boiler, steam and hot water systems
    - Efficient process heating technologies
    - Efficient space heating and ventilation, including solar thermal technologies.

5.2 INDUSTRIAL NATURAL GAS SAVINGS POTENTIAL

A summary of the levels of annual natural gas consumption and potential natural gas savings contained in each of the Industrial sector forecasts addressed by the study are presented in Exhibits 5.1 to 5.3 and discussed briefly in the sub sections that follow.

Exhibit 5.1: Graphic of Forecast Results for the Enbridge Service Area – Annual Natural Gas Consumption, Industrial Sector (million m^3/yr)

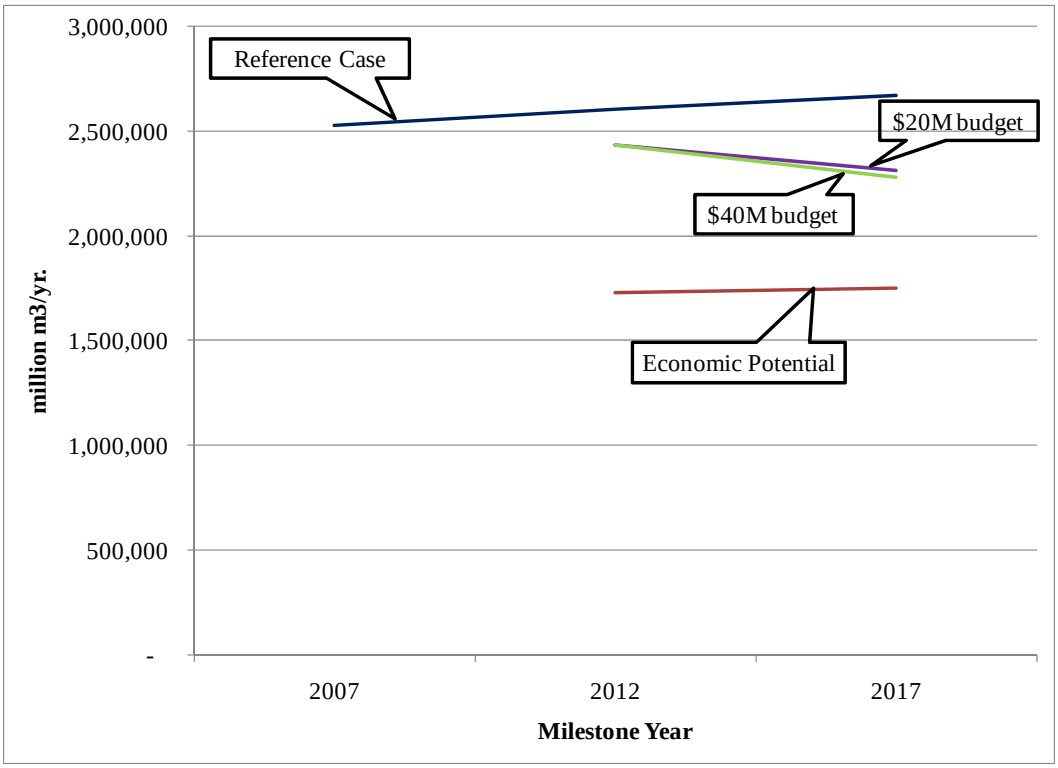

Exhibit 5.2: Summary of Forecast Results for the Total Enbridge Service Area - Annual Natural Gas Consumption, Industrial Sector (million m^3/yr)

Milestone Year	Annual Consumption in Industrial Sector (million m^3/yr)					
	Reference Case	Economic Potential	Achievable Potential			
			$20M Scenario*	$40M Scenario**	$60M Scenario	Financially Unconstrained
2007	2,530					
2012	2,604	1,726	2,433	***	***	2,433
2017	2,671	1,751	2,316	2,278	****	2,278

Exhibit 5.3: Summary of Forecast Results for the Total Enbridge Service Area – Achievable Natural Gas Savings in Milestone Years, Industrial Sector (million m^3/yr. and % Relative to Economic Potential Scenario)

Milestone Year	Natural Gas Savings (million m^3/yr., Relative to Economic Potential %)				
	Economic Potential	Achievable Potential			
		$20M Scenario*	$40M Scenario**	$60M Scenario	Financially Unconstrained
2012	877	171	***	***	171
2017	919	355	392	****	392
2012		19%	***	***	19%
2017		39%	43%	****	43%

Note**:** Natural gas savings in the milestone years represent the potential reduction in gas use in that year as a result of DSM measures implemented in the period.

* Estimated annual program costs for implementing all cost-effective measures is $3.1 million in 2012, moderately less than the $4 million allocated to the industrial sector in the $20 million DSM scenario. Results reported are for $3.1 million, and represent the maximum savings for the achievable scenario in 2012.

** Estimated annual program costs for implementing all cost-effective measures is $4.4 million in 2017, significantly less than the $8 million allocated to the industrial sector in the $40 million DSM scenario. Results reported are for $4.4 million, and represent the maximum savings for the achievable scenario in 2017.

*** Maximum measure implementation rates are achieved in the $20 million scenario in 2012. Based on the Achievable workshop results, no additional savings were identified in the $40 million, $60 million or Financially Unconstrained scenarios, while maintaining a positive TRC.

**** Maximum measure implementation rates are achieved in the $40 million scenario in 2017. Based on the Achievable workshop results, no additional savings were identified in the $60 million or Financially Unconstrained scenarios, while maintaining a positive TRC.

5.3 BASE YEAR NATURAL GAS USE

In the Base Year of 2007, the Industrial sector in Enbridge's total service area consumed about 2,529,979,000 m^3. This volume excludes natural gas used for power generation, co-generation and industrial feedstock, as these uses of natural gas are beyond the scope of this study.

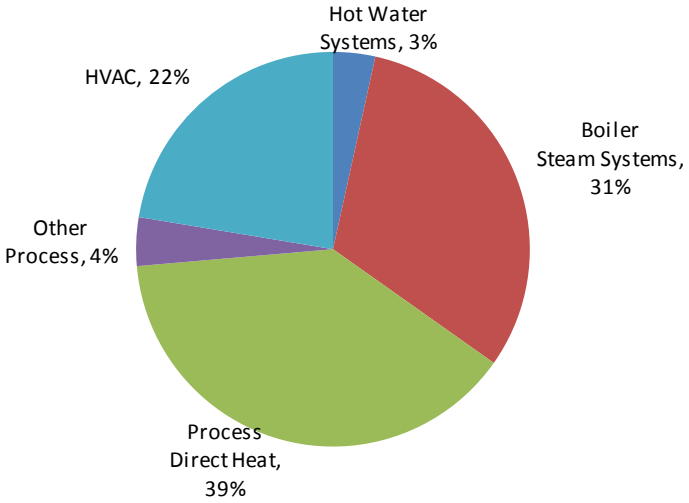
The 7 core industry sub sectors shown in Exhibit 5.4 account for 67% of the total industry natural gas consumption; 88% of the total industry natural gas consumption occurs in the central service region.

Exhibit 5.4: Base Year Industrial Sector Natural Gas Consumption for the Total Enbridge Service Area (1,000 m^3/yr.)

Sub Sector	End Use						
	Hot Water Systems	Boiler Steam Systems	Process Direct Heat	Other Process	HVAC	Total	Percentage of Total (%)
Non-metallic Mineral Product Mfg.	6,655	39,798	235,793	12,578	37,935	332,759	13%
Food Product Mfg.	26,125	156,162	89,772	20,214	34,289	326,563	13%
Paper Manufacturing	5,820	181,547	55,113	5,325	43,182	290,987	11%
Refined Petroleum & Coal	8,556	74,155	165,423	4,563	32,514	285,213	11%
Primary Metal	3,663	21,518	127,953	4,175	25,821	183,131	7%
Fabricated Metal	7,313	34,736	85,927	9,141	45,706	182,822	7%
Chemical	3,514	71,337	57,983	12,966	29,907	175,706	7%
Miscellaneous Mfg.	27,526	222,764	222,175	34,790	326,329	833,584	33%
Total	87,557	792,355	982,895	100,699	566,473	2,529,979	100%
Percentage	3%	31%	39%	4%	22%		

As illustrated in Exhibit 5.5 process direct heat accounts for about 39% of total industrial sector natural gas use. Boiler steam systems account for about 31% of the total natural gas use, followed by heating, ventilation and air conditioning (HVAC), which accounts for about 22%. Other processes and hot water systems account for the remaining natural gas consumption.

Exhibit 5.5: Base Year Industrial Sector Natural Gas Use for the Total Enbridge Service Area, by End Use



5.4 REFERENCE CASE

In the absence of new DSM initiatives, the study estimates that natural gas consumption in the Industrial sector will grow from 2,529,979,000 $m^{3/}$yr in 2007 to about 2,670,651,000 $m^{3/}$yr in 2017. This represents an overall growth of about 5.6% in the period and compares very closely with Enbridge's own forecast, which also includes consideration of the impacts of "natural conservation." Exhibit 5.6 shows the forecast levels of Industrial sector natural gas consumption for the entire Enbridge service area. The results are presented for each milestone year and sub sector.

Exhibit 5.6: Industrial Sector Reference Case Natural Gas Use for the Total Enbridge Service Area, by Sub Sector and Milestone Year (1000 m^3/yr)

5.5 ASSESSMENT OF ENERGY EFFICIENCY MEASURES

The study assessed over 30 potential energy efficiency measures. A summary of the screening results for the energy-efficiency measures is presented in Exhibit 5.7. Due to the number of measures assessed for each sub sector the results shown are for the measures applied to a large technology group in the Chemical sub sector.

Exhibit 5.7: Summary of Measure TRC Screening Results — Example for Chemical Sub Sector, Large Technology Energy-efficiency Options

End Use	Measure	Full/ Incremental	Net Measure TRC	Simple Payback Period (Years)	Benefit/ Cost Ratio

5.6 ECONOMIC POTENTIAL FORECAST

Under the conditions of the Economic Potential Forecast,[26] the study estimated that natural gas consumption in the Industrial sector would decline to about 1,751,313,000 $m^{3/}$yr by 2017 for the total Enbridge service area. Annual savings relative to the Reference Case are about 919,340,000 $m^{3/}$yr by 2017, or about 34%. %. Further details are provided in Exhibits 5.8 and 5.9, which show the results by sub sector and end use for the milestone years 2012 and 2017, respectively.

Exhibit 5.8: Natural Gas Savings for the Total Enbridge Service Area by Sub Sector and End Use for the Milestone Year 2012, Reference Case vs. Economic Potential (1000 m^3/yr.)

	End Use							
Sub Sector	**System**	**Hot Water Systems**	**Boiler Steam Systems**	**Process Direct Heat**	**Other Process**	**HVAC**	**Total**

5.6.1 Sensitivity Analysis

The Economic Potential results were subjected to a sensitivity analysis around two of the assumptions employed: Technology Cost and inclusion of a value for GHG emissions (as described in Step 5, in Section 1.4). The two sensitivity analyses offer the following insights:

[26] The level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost-effective. In this study, "cost-effective" means that the technology upgrade passes the measure Total Resource Cost (TRC) test, as discussed previously in Section 1.4.

- In the Industrial sector, the additional measures included in the technology cost sensitivity analysis provide only modest additional savings relative to the technologies already included in the Economic Potential Forecast.

- The sensitivity analysis identified potential savings of about 1,015 million m^3 in 2017; this compares with the identified savings potential of about 919 million m^3 in 2017 under the Economic Potential Forecast. Hence, the identified technical savings potential is about 12% greater than that identified in the Economic Potential Forecast.

- The GHG adder makes a relatively small difference to the overall avoided cost of energy.

5.7 ACHIEVABLE POTENTIAL

As noted previously, Achievable Potential was assessed from two perspectives:

- Potential Savings in Future Natural Gas Consumption Savings in one year due to the Aggregate impact of measures implemented over the time period of Base Year (2007) to Milestone Year (2012 and 2017). This method calculates the net change in future natural gas supply requirements.

- Potential DSM Program TRC Benefits. [27] Savings due to (only) those measures implemented in one year. This method is used in calculation of the net TRC benefits.

Within each of the above perspectives, the analysis of Achievable Potential was assessed under four different Marketing scenarios:

- One Financially Unconstrained scenario
- Three Financially Constrained scenarios, each limited by a different level of program budget availability.

Further detail related to each of the Marketing scenarios is provided below followed by a summary of results.

5.7.1 Financially Unconstrained DSM Marketing Scenario

The Financially Unconstrained scenario provides an overview of the level of potential natural gas savings that could be achieved if a comprehensive portfolio of DSM programs was launched without any constraint on the availability of program funding.

[27] The annual savings presented do not explicitly address the potential impact of free riders at the level of individual program measure. However, the Reference Case 3 does include an estimate of the impact of natural conservation over the study period, by end use (i.e., an estimate of natural gas savings that would occur in the absence of additional Enbridge DSM programs). Hence, the inclusion of natural conservation in the study's Reference Case does address some, but not necessarily all, free rider and spillover impacts. A more detailed assessment of free rider and spillover impacts is practical only as part of a detailed program design, which is beyond the scope of this study.

Although the results of this scenario are not constrained by program funding, the results do incorporate consideration of the market constraints identified during the Achievable Potential workshop, such as product and service availability and customer transaction costs.

This scenario, therefore, provides a high-level estimate of the upper level of natural gas savings that could be achieved by Enbridge's industrial customers over the nine-year period beginning in 2009 and ending in 2017. It also provides Enbridge's industrial DSM program personnel with a view of the relative potential contribution of individual sub sectors, end uses, technologies and service regions.

Major Assumptions: Financially Unconstrained Scenario

- All measures that pass the measure TRC screen are included
- No program financial limit is set, except that all measures must continue to pass the measure TRC screen
- Participation rates for each measure are based on the workshop results, which consider both market barriers and potential promotional strategies.

Exhibit 5.10 provides details on the program costs assumed for each measure.

Exhibit 5.10: Summary of Program Cost Assumptions, Financially Unconstrained Scenario[28]

End Use	Bundle	Measure Name	Fixed Program Costs ($/yr)	Incentive ($/m^3)	Payback After Incentive (yrs)[29]

[28] Salary and related overhead costs are not included in program cost estimates.

[29] The payback period is a weighted average payback period for the measures based on technology size distribution and gas consumption by sub sector.

5.7.2 Financially Constrained DSM Marketing Scenarios

These DSM Marketing scenarios provide estimates of the potential impacts of increasingly larger annual DSM budgets, which as noted previously were set at $20, $40 and $60 million, annually. Within each of these budgets, 20% of the funding is allocated to the Industrial sector for the purposes of this analysis.

The financially constrained scenarios include the following DSM costs:

- **Fixed Program Costs**: This includes costs for items such as newspaper advertisements, preparation of information and marketing materials, training workshops, contractor certifications, etc. These program cost elements are not expected to vary significantly if the number of installations of the measure changed. Estimates for these cost items were provided by Enbridge personnel, based on current and previous experience with similar DSM measures. In each case, these costs are expressed as dollars of program spending per year. For each of the measures, fixed program costs were estimated for both the CML and Financially Unconstrained Marketing scenarios. Salary and related overhead costs are not included.

- **Incentive Costs** (either end user or channel member): These costs would include any costs that vary directly according to the volume of gas saved by the measure. An incentive of $ 0.05 / m^3 gas saved was used for the CML scenario and $ 0.07 / m^3 gas saved for the Financially Unconstrained scenario. For each of the measures, incentive costs were estimated for both the CML and the Financially Unconstrained scenarios based on the volume of gas saved.

Exhibit 5.11 provides details on the program costs assumed for each measure.

Exhibit 5.11: Summary of Program Cost Assumptions, CML Scenario[30]

[30] Salary and related overhead costs are not included in program cost estimates.

[31] The payback period is a weighted average payback period for the measures based on technology size distribution and gas consumption by sub sector.

5.7.3 Achievable Potential Savings - Future Natural Gas Consumption[32]

Exhibits 5.12 to 5.14, inclusive, present a summary of the Achievable Potential savings in future natural gas consumption relative to the Reference Case levels. For illustration, the results of the Financially Unconstrained scenario are shown.

Selected highlights are provided below.

- Exhibit 5.12 shows that total industrial sector natural gas savings in 2017 are estimated to be approximately 392 million m^3/yr. This represents a savings of approximately 15%, relative to the Reference Case and is equal to approximately 43% of the savings identified in the Economic Potential Forecast. The Central service region accounts for about 87% of the identified potential.

- Exhibit 5.13 shows the results by sub sector for the entire Enbridge service area. As illustrated, the majority of savings in the unconstrained scenario are associated with the Miscellaneous Manufacturing sub-sector (39%), while the Food Product Manufacturing and Paper Manufacturing sub sectors each contribute approximately 12% each.

- Exhibit 5.14 shows the results by end use. As illustrated, measures applied to three end-uses, boiler steam systems, HVAC, and process heat, account for approximately 93% of the identified potential. Additional details describing the specific measures that contribute to these end-use savings are provided in the following sections.

Exhibit 5.12: Natural Gas Savings by Service Region and Milestone Year, Financially Unconstrained Scenario (1000 m^3/yr.)

Milestone Year	Eastern Region	Central Region	Total	% Savings Relative to Ref Case
	thousand m^3/year			
2012	21,055	149,446	170,501	7%

6.7.4 Potential DSM Program TRC Benefits

Exhibits 5.15, 5.16 and 5.17, present the results for the milestone year 2017. As illustrated, annual industrial program spending of approximately $4.4 million in 2017 would result in approximately 48 million m^3/year in natural gas savings[33] and approximately $44 million in TRC net benefits. The exhibits also illustrate that annual Industrial sector program spending achieves maximum results at an annual expenditure of $3.1 million in 2012, which is below the $4 million industrial budget, and $4.4 million in 2017, which is below the $8 million industrial budget. This is because additional cost-effective measures were not available under the conditions defined by these scenarios. Additional details are provided in the following exhibits.

33 Note: the savings shown are only for the measures installed in 2017; they do not include the savings in 2017 that occur as a result of measures installed in prior periods.

- Exhibit 5.15 presents the 2017 results by upgrade technology bundle, including both the current marketing level of participation and the increment from current marketing level to Financially Unconstrained. For each measure bundle, annual natural gas savings potential, net TRC benefits, and annual program costs are presented both individually and cumulatively. The measures are sorted in order of increasing program cost per dollar of TRC benefits.

- Exhibit 5.16 presents the 2017 results graphically, with program costs on the vertical axis and net TRC benefits on the horizontal axis.

- Exhibit 5.17 presents the 2017 results graphically, with program costs on the vertical axis and annual natural gas savings potential on the horizontal axis.

Exhibit 5.15: Summary Achievable Results** by Measure, for the Total Enbridge Service Area, 2017 Installations

Schedule 7

Exhibit 5.16: Achievable Potential Supply Curve, 2017: Program Cost vs. TRC Net Benefits, for the Total Enbridge Service Area

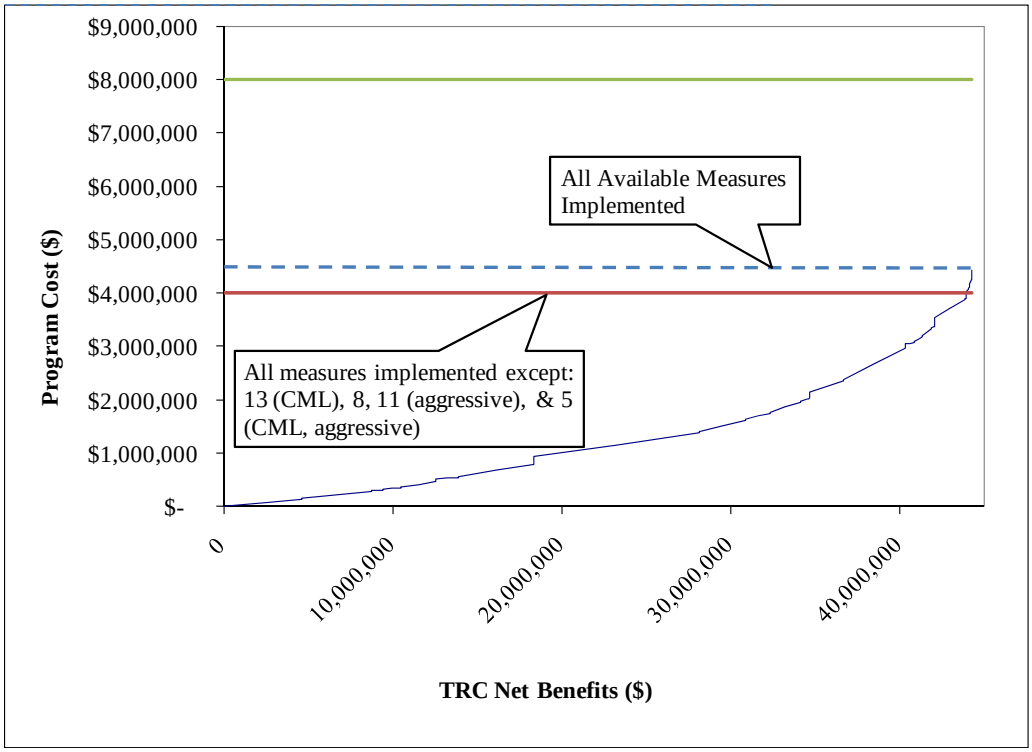

Exhibit 5.17: Achievable Potential Supply Curve, 2017: Program Cost vs. Annual Natural Gas Savings Potential, for the Total Enbridge Service Area

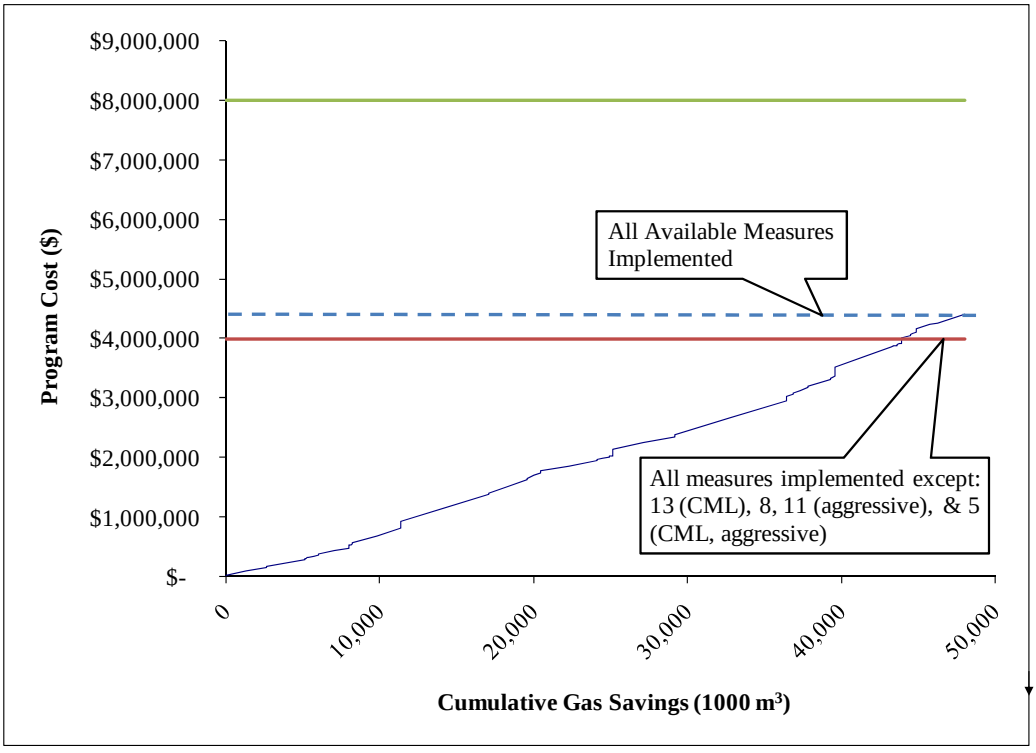


5.7.5 Conclusions

Selected highlights are provided below.

- Annual Industrial sector program spending achieves maximum results at an annual expenditure of $3.1 million in 2012, which is below the $4 million industrial budget, and $4.4 million in 2017, which is below the $8 million industrial budget. This is because additional cost-effective measures were not available under the conditions defined by these scenarios.

- With industrial program spending of approximately $4.4 million in 2017, program costs are approximately $0.09 per gross m^3 of natural gas savings and $0.09 per dollar of gross TRC benefits. This compares with recent Enbridge monitoring and evaluation results[34] of $0.06/$m^3$ of gross natural gas savings ($0.07/$m^3$ net of free riders).

- Program costs per dollar of TRC net benefits are particularly attractive for the following measure bundles:
  - Bundle 10 – Retrofitting ovens, dryers, kilns and furnaces to improve efficiency, such as exhaust gas heat recovery, high efficiency burners, insulation and advanced heating and process controls
  - Bundle 1 – System wide integrated control systems
  - Bundle 9 – Upgrading to more efficient boilers and heaters, such as condensing boilers and direct contact hot water heaters
  - Bundle 12 – Process heat recovery
  - Bundle 2 – System wide sub-metering
  - Bundle 4 – Boiler right sizing and load management

5.8 ADDITIONAL OBSERVATIONS

In addition to the preceding conclusions, two additional observations warrant note as they may affect future Industrial sector program strategies. They include:

- ***Rate of measure implementation has a large effect on overall savings:*** For measures that pass the TRC screen on an incremental cost basis, low participation rates in early milestone years create a significant "lost opportunity." This is particularly relevant to the replacement of equipment with a very long life, which is applicable to most industrial technologies and measures. The gap between Economic Potential and Achievable Potential savings presented in this study is due in large part to the significant lost opportunity that occurs in early milestone years.

- ***Bundling of measures to develop program concepts has an impact on the achievable potential and program development:*** To model the achievable potential scenario measures were grouped into bundles that are manageable within the scope and budget of the project. The Achievable results provide an indicative savings potential based on the

[34] Enbridge Gas, 2007 LRAM Post Audit Results.

specific set of bundles. Savings from individual measures, or different bundle mixes of measures, will vary.

GLOSSARY

achievable potential
The Achievable Potential is the proportion of the natural gas savings identified in the Economic Potential Forecast that could realistically be achieved within the study period. Achievable Potential recognizes that it is difficult to induce customers to purchase and install all of the efficiency technologies that meet the criteria defined by the Economic Potential Forecast.

avoided cost
The unit cost of acquiring the next resource to meet demand, which is used as a measure for evaluating individual demand-side and supply-side options. In the context of this study "avoided cost" is the capital expenditure offset by Enbridge's DSM activities (i.e., the cost of having to buy natural gas on the open market, contract for long-term supply, and the cost of associated transmission and storage.

base year
The Base Year is the year to which all potentials will be compared. It provides a detailed description of "where" and "how" natural gas is currently used in each sector. For this study, it is the calendar year 2007. The modelled base year energy use is calibrated against Enbridge's actual sales for 2007.

benefit/cost ratio
The measure benefit/cost ratio indicates the relative attractiveness of the measures. A measure that has a benefit/cost ratio in excess of 1.0 has benefits which outweigh its costs. Similarly, a measure with a benefit/cost ratio that is well in excess of one (e.g., 3.0) means that it is very attractive. A measure with a benefit/cost ratio of less than 1.0 has costs which outweigh its benefits.

building envelope
The material separation between the interior and the exterior environments of a building. The building envelope serves as the outer shell to protect the indoor environment as well as to facilitate its climate control.

british thermal unit or BTU
The standard measure of heat energy. It takes one Btu to raise the temperature of one pound of water by one degree Fahrenheit at sea level

co-generation
The simultaneous production of electric or mechanical energy and useful heat energy from a single fuel source.

combustion efficiency
The ratio of energy released during combustion to the potential chemical energy available in the fuel.

demand-side management (DSM)
Actions taken by a utility or other agency which are expected to influence the amount or timing of a customers energy consumption.

discount rate
The interest rate used in calculating the present value of expected yearly benefits and costs.

economic efficiency
Allocation of human and natural resources in a way that results in the greatest net economic benefit, regardless of how benefits and costs are distributed within society.

economic potential forecast
The economic potential forecast is an estimate of the level of natural gas consumption that would occur if all equipment and building envelopes were upgraded to the level that is cost effective from society's perspective. All of the energy-efficiency technologies and measures that have a positive measure TRC are incorporated into the economic potential forecast. These technologies and measures are applied at either natural stock turnover rates or at designated years for immediate application.

energy audit
An on-site inspection and cataloguing of energy using equipment/buildings, energy consumption and the related end-uses. The purpose is to provide information to the customer and the utility. Audits are useful for load research, for DSM program design and for identification of specific energy savings measures.

energy conservation
Activities by energy users that result in a reduction of the energy used to provide services. Energy conservation can include a wide variety of behavioural or operational changes that result in energy savings..

Energy efficiency
Using less energy to perform the same function. For the purpose of this study, only energy savings achieved through physical or hardware installations are considered.

energy intensity
The ratio of energy consumed per application or end use. For example, cubic metres per square metre of heated office space per day, or cubic metres per tonne of aluminum produced. All else being equal, energy intensity increases as energy efficiency decreases.

emerging technologies
New energy-conserving technologies that are not yet market-ready, but may be market-ready over next 5 to 10 years. This category includes technologies that could be accelerated into the market during that period through targeted financial or technical support.

end use
The final application or final use to which energy is applied. End use is often used interchangeably with energy service.

energy savings
The reduction in use of energy from the pre retrofit baseline to the post retrofit energy use that result from efficient technologies or activities. In this document, the term "energy" refers specifically to energy derived from natural gas unless otherwise noted.

energy service
An amenity or service supplied jointly by energy and other components/equipment such as buildings and heating equipment. Examples of energy services include residential space heating, commercial cooking, aluminum smelting and public transit. The same energy service can frequently be supplied with different mixes of equipment and energy.

energy use index (EUI)
End use energy consumption divided by a specific parameter of production (e.g., m^3/unit)
environmental credit/environmental penalty
An increment or decrement to the cost of a resource or set of resources, to reflect the overall level of its/their environmental impact, relative to another resource or set of resources.

financial incentive
Certain financial features in the utility's DSM programs designed to motivate customer participation. They may include features designed to reduce a customer's net cash outlay, pay-back period or cost of finance to participate.

fuel share
The proportion of requirements for a specific service that is met using a certain fuel. In the Commercial sector, fuel shares are normalized on a floor area basis. For example, a natural gas fuel share of 90% for space heating in the Large Office sub sector implies that 90% of the sub sector floor space is heated using natural gas.

free rider
A program participant who would have implemented the program measure or practice in the absence of the program.

interactive effects
In the context of natural gas use, interactive effects refer to the increase in gas consumed by heating equipment required to offset a decrease in "waste" heat generated by more efficient electrical fixtures or appliances after retrofit or replacement.

kilowatt (kW)
One thousand watts; the most common unit of measurement of electric power. (The amount of energy transferred at a rate of one kilowatt for one hour is equal to one kilowatt hour.)

kilowatt hour (kWh)
The most common unit of measurement of electric energy. One kilowatt hour represents the power of one thousand watts for a period of one hour.

load forecast
An estimate of expected natural gas requirements that have to be met by the utility in future years.

load research
Research to disaggregate and analyze patterns of natural gas consumption by various subsectors and end-uses. Load Research supports the development of the load forecast and the design of demand-side management programs.

market transformation
A reduction in market barriers resulting from a market intervention, as evident by a set of market effects that lasts after the intervention has been withdrawn, reduced or changed.

measure total resource cost (TRC)
The Measure TRC is the net present value of energy savings that result from an investment in a energy efficiency measure. The Measure TRC is equal to its full or incremental capital cost (depending on application) plus any change (positive or negative) in the combined annual energy and operating & maintenance costs. This calculation includes among others, the following inputs: the avoided natural gas, electricity and water; the life of the measure; and the selected discount rate.

natural conservation
The future change in energy intensity or base usage that is expected to occur in the absence of utility DSM programs. Natural change represents the effects of energy related decisions that would have been made in the absence of the utility programs by both program participants and non-participants

Non-participant:
Any customer who was eligible but did not participate in the utility program under consideration in a given program year.

non-participant test (NPT)
A test measuring what happens to rates due to changes in utility revenues and operating costs caused by a program. Rates will go down if the avoided cost is greater than the sum of the revenue lost plus the program costs. This test indicates the direction and magnitude of the expected change in rate levels.

participant
An individual, household, business or other utility customer that received a service or financial assistance orffered through a particular utility program, set of utility programs or particular aspect of a utility program in a given program year.

rate
Generically refers to a utility's rate structure.

rate structure
The formulae used by a regulated gas utility to calculate charges for the use of natural gas..

rebates
A type of incentive provided to encourage the adoption of energy efficeing practices, typically paid after the measure has been installed. There are typically two types of rebates: a Prescriptive Rebate, which is a prescribed financial incentive/unit for a prescribed list of products and a

customized rebate in which the financial incentive is determined using an analysis of the customer equipment and an agreement on the specific products to be installed.

reference case forecast
An estimate of the expected level of natural gas consumption that would occur over the study period in the absence of any new utility DSM market interventions after 2008. It is the baseline against which the scenarios of energy savings are calculated. The Reference Case forecast incorporates an estimation of "natural conservation," namely, changes in end-use efficiency over the study period that are projected to occur in the absence of new market interventions by the utility.

retrofit
Energy efficiency activities undertaken in existing residential or non residential buildings where existing inefficient equipment is replaced by efficient equipment.

saturation
The portion of floor area that receives a specific energy service. For example, a saturation of 86% for space cooling in the Large Office sub sector means that 86% of the sub sector floor space is cooled (regardless of fuel used to provide that cooling).

seasonal efficiency
The ratio of delivered useful energy relative to the input potential fuel energy determined over a full heating season (or year).

sector
A group of customers having a common type of economic activity. Enbridge Gas divides its customers into three principal sectors: Residential, Commercial and Industrial. Sectors are further divided into subsectors. For example, "Large Offices" is a sub sector of the Commercial sector.

service area
The portion of the Province of Ontario that receives service from Enbridge Gas.

service region
For the purposes of this study, the total Enbridge Gas service area is divided into two service regions. They are the Southern Region and the Eastern Region.

simple payback
The simple payback is generated to show the customer's financial perspective. Simple payback is a measure of the length of time required for the cumulative savings from a project to recover its initial investment cost, without taking into account the time value of money

strategic load growth
Utility action to increase (annual) total natural gas demand for specific end uses.

sub sectors
A classification of customers within a sector by common features. Residential subsectors are by type of home (SFD, duplex, apartment, etc.). Commercial subsectors are generally by type of

commercial service (office, retail, warehouse, etc.). Industrial subsectors are by product type (pulp and paper, solid wood products, chemicals, etc.).

supply curves
A curve illustrating the amount of energy (e.g., m^3) or societal benefit available at an appropriate screened price in ascending order of cost.

Total Resource Cost (TRC) Test
A test that compares the total costs of energy efficiency investments, including natural gas conservation programs, to the social cost of natural gas. Un-priced environmental and social costs may be accounted for by changing the cost of either the investment under consideration or the total cost of natural gas in such a way that relative un-priced impacts are reflected. It is used in designing and evaluating programs that are developed from the Energy Efficiency Potential study's results.

utility cost
The total financial cost incurred by the utility to acquire energy resources. For DSM, the costs include all utility program costs, including incentive costs.

watt
The basic unit of measurement of power, at a point in time as capacity or demand.

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #15

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 8

Please provide the following information with respect to Enbridge's actual/forecast number of power plant customers in the GTA Project Influence Area for each year from 2000 to 2025 inclusive:

a) Number of power plants;

b) Peak hour demands (TJ/hour);

c) Peak day demands (TJ/day); and

d) Annual demands (TJ/year).

RESPONSE

a) There are three large embedded power plants in the GTA Project Influence Area. One commenced gas service prior to 2000, one in 2006, and one in 2008. There is no additional demand from power plants forecasted from 2015 to 2025 in the GTA Project Influence Area.

b) Aggregated peak hour contract demand for the power plants is 5,500 GJ/hr.

c) Aggregated peak day contract demand for the power plants is 131,996 GJ/day.

d) Actual annual demand information for the power plants is confidential and not relevant in this application as the system is designed to accommodate the peak hourly demand.

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #16

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex A, Tab 3, Schedule 4

The Government of Ontario is planning to reduce the province's greenhouse gas emissions, relative to 1990 levels, by: a) 6% by 2014; b) 15% by 2020; and c) 80% by 2050.

Does Enbridge have an analysis to show that the projected increase in natural gas consumption in the GTA Project Influence Area is consistent with a politically feasible and cost-effective strategy to achieve Ontario's greenhouse gas emission reduction goals? If yes, please provide.

RESPONSE

Enbridge has not analyzed the projected increase in natural gas consumption in the GTA Project Influence Area in relation to Ontario's greenhouse gas emission reduction goals. Such an analysis is properly the subject of a regional or provincial policy review.

Witnesses: T. MacLean
F. Oliver-Glasford
J. Ramsay

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #17

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex A, Tab 3, Schedule 8, page 1

Please state the peak hour (TJ/hour) or peak day (TJ/day) demand in the GTA Project Influence Area that would cause the pressure at Station B in the 2015/2016 heating season to drop below minimum system requirements.

RESPONSE

As summarized in Exhibit A, Tab 3, Schedule 4, Table 3, forecast peak load will drop the system below minimum system pressure required by winter 2015/16. Specifically a forecast load of 3037 10^3m^3/hr would cause the XHP system to drop below the minimum system pressure required.

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #18

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex A, Tab 3, Schedule 7, page 3

Please explain why Enbridge believes that "[c]onservation efforts… cannot be expected to replace the capacity within the system due to the lowering of pressures on large diameter, higher pressure lines."

RESPONSE

Enbridge believes that the magnitude of conservation required to replace the capacity within the system due to the lowering of pressures on large diameter, higher pressure lines is too large to be achievable. Based on estimates consistent with those shown in the response to Environmental Defence Interrogatory #14 found at Exhibit I.A4.EGD.ED.14, the DSM requirement needed to lower the pressure as proposed in the NPS 26 and NPS 30 Don Valley line would be a greater than a 20-fold increase in the GTA. In addition to the sheer scale of the conservation that would be required, the certainty of achieving the conservation targets is unknown. Magnitude and certainty make conservation a non-viable option for replacing capacity as a result of lowering pressures in existing infrastructure.

The primary purpose of the application is for increased safety and reliability in the delivery of natural gas, as stated in Exhibit A, Tab 3, Schedule 1. Enbridge is of the opinion that even if load growth and lowered capacity were offset by efficiency gains, which we do not believe is a reasonable assumption, that the proposed facilities would not be significantly altered, as they are required to meet the other objectives of the project.

Witnesses: T. MacLean
F. Oliver-Glasford
J. Ramsay

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #19

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex A, Tab 3, Schedule 7, pages 15 & 16

In its analysis of alternatives, Enbridge states as follows:

As mentioned in Exhibit A, Tab 3, Schedule 2, the need for the pipeline NPS 36 XHP segment from Keele/CNR Station to the NPS 30 Don Valley line was originally identified as Parkway Phase 3. This project was initially planned in the early 1990's, then revisited in the early 2000's, but postponed until now since the additional west to east gas transportation volumes could be delivered by TransCanada under short haul contracts.

a) When did Enbridge start to analyse the potential for incremental DSM programs and budgets to defer the need for some or all of the proposed GTA Pipeline Project? Please provide copies of the written materials prepared by Enbridge in this regard corresponding to this start date.

b) Please state the dates (if any) when Enbridge consulted with the DSM Consultative regarding the potential for incremental DSM programs and budgets to avoid or defer the need for some or all of the proposed GTA Pipeline Project? Please provide copies of the written materials that were provided to the DSM Consultative participants on this matter.

RESPONSE

a) In the screening phase of potential alternatives increased DSM was reviewed but was screened out as an alternative. Although it had some potential for decreasing peak loads, DSM could not be expected to meet the other objectives, specifically dealing with the supply chain reliability issues, nor could it reasonably be expected to allow for lowering of pressures on the key supply lines within the GTA.

b) Enbridge did not consult with the DSM Consultative with respect to this project.

Witness: C. Fernandes

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #20

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 7, pages 1-3

Has Enbridge analysed the potential for incremental DSM measures, programs and budgets to defer the need for all or part of the proposed GTA Pipeline Project? If yes, please provide copies of all of these analyses and studies.

RESPONSE

The GTA Project has multiple purposes. It meets customer growth, reduces operational risks, enhances safety and reliability, provides entry point diversity, improves supply chain diversity and reduces upstream supply risks and costs. (See Exhibit A, Tab 3, Schedule 1).

DSM may be able to address some of the growth demand, but not reliability, entry point and distribution system diversity, or supply chain needs. If there were no load growth, all of the project facilities would be required in order to meet the other objectives.

Considering a "growth only" scenario alone:

- The growth forecast has already incorporated conservation at current levels.
- To offset all the forecasted growth, it is estimated that an overall DSM budget twice the current level, with the entirety of the incremental spend used for the GTA Project Influence Area, is required every year moving forward.
- The "growth only" component of the GTA Project, namely the extension of the NPS 36 line from Sheppard north to McNicol Avenue is estimated to cost $40M to $50M.[1]

[1] Unclassified estimate.

Witnesses: J. Ramsay
R. Sigurdson
C. Fernandes

- The timeframe required to increase DSM programs is insufficient given the scale and date the delivered results are required.
- It is uncertain whether and when the conservation targets can be achieved, noting the fact that the Company has not fully utilized its budget opportunity historically.

Given the uncertainty and challenge in scaling DSM programs to address the growth objective, and given that reliability and upstream concerns (as stated in Exhibit A, Tab 3, Schedule 5) cannot be resolved by any DSM efforts, DSM measures are not a viable alternative to the GTA Project. As a result, no in-depth analysis of potential incremental DSM measures, programs and budgets was undertaken.

Witnesses: J. Ramsay
R. Sigurdson
C. Fernandes

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #21

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 8, page 1

a) Please state the forecast dollar impact of the GTA Pipeline Project on Enbridge's revenue requirement in: a) 2016; b) 2017; and c) 2018.

b) Please state the forecast percentage increase in Enbridge's distribution rates in: a) 2016; b) 2017; and c) 2018 due to the GTA Pipeline Project. Please also provide the forecast percentage rate increases in each of these three years for each of Enbridge's customer classes (e.g., residential, small commercial, large commercial, small industrial, large industrial).

RESPONSE

a) The forecast revenue requirements of the project for 2016, 2017, and 2018 are $57.6 million, $57.0 million and $56.3 million[1].

b) The total revenue requirement of the GTA Project for 2016 is $57.6 million. TCPL's shared portion of Segment A is $11.8 million resulting in a net revenue requirement to be recovered from EGD's customers of $45.8 million. The estimated annual rate impact for 2016 (relative to existing April 1, 2013 QRAM rates) for the GTA Project by customer rate class is as follows:

[1] Please see response to Board Staff Interrogatory #48 found at Exhibit I.D5.EGD.STAFF.48 and the response to CME Interrogatory #10 found at I.A3.EGD.CME.10 for details.

Witnesses: K. Culbert
A. Kacicnik

	BUNDLED RATES	
Rate Class	**Sales Service**	**T-Service**
1	1.4%	2.1%
6	1.5%	2.9%
9	0.5%	0.9%
100	0.7%	1.9%
110	0.7%	1.9%
115	0.5%	1.3%
135	0.2%	0.6%
145	0.6%	1.5%
170	0.2%	0.7%
200	1.6%	3.8%
	UNBUNDLED RATES	
125	23.9%	
300	8.7%	

Based on the Rate 1 rate class average, a residential customer on sales or t-service will see an annual increase of approximately $11.6 annually or $1 per month. As the change in revenue requirement for 2017 and 2018 are a slight decrease, all other things being equal, there would be a slight decrease in rates for these years.

Please note the rate impacts depicted above are based solely on the increase in EGD's revenue requirement stemming from the GTA Project. However, as indicated at Exhibit E, Tab 1, Schedule 1, Page 8, the Company has identified significant savings in gas transportation costs resulting from the GTA proposal. These gas cost savings will flow through to customer's rates and bills through a reduction in EGD's annual forecast of gas costs (relative to today's status quo scenario). For 2016, the total savings identified for EGD's sales and western t-service customers as well as potential savings for its Ontario T-service customers is $148.9 million. EGD's sales and western t-service customer's portion is approximately $92.2 million. Therefore, the 2016 net impact on EGD's customer's bills would be a reduction in revenue requirement of $34.6 million ($57.6 – $92.2). The estimated annual rate impact for 2016 (relative to existing April 1, 2013 QRAM rates) for the

GTA Project and forecast gas transportation savings by customer rate class is as follows:

		BUNDLED RATES		
Rate Class		**Sales Service**		**T-Service**
1		-1.4%		-2.2%
6		-1.7%		-3.3%
9		-6.3%		-10.8%
100		-1.4%		-3.6%
110		-1.4%		-3.6%
115		0.5%		1.3%
135		-4.1%		-12.0%
145		-2.4%		-6.4%
170		-1.4%		-4.7%
200		-4.0%		-9.6%
		UNBUNDLED RATES		
125		23.9%		
300		8.7%		

Based on the Rate 1 rate class average, a residential customer on sales or t-service will see an annual decrease of approximately $10.6 annually or $1 per month.

Witnesses: K. Culbert
A. Kacicnik

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #22

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 3, page 11

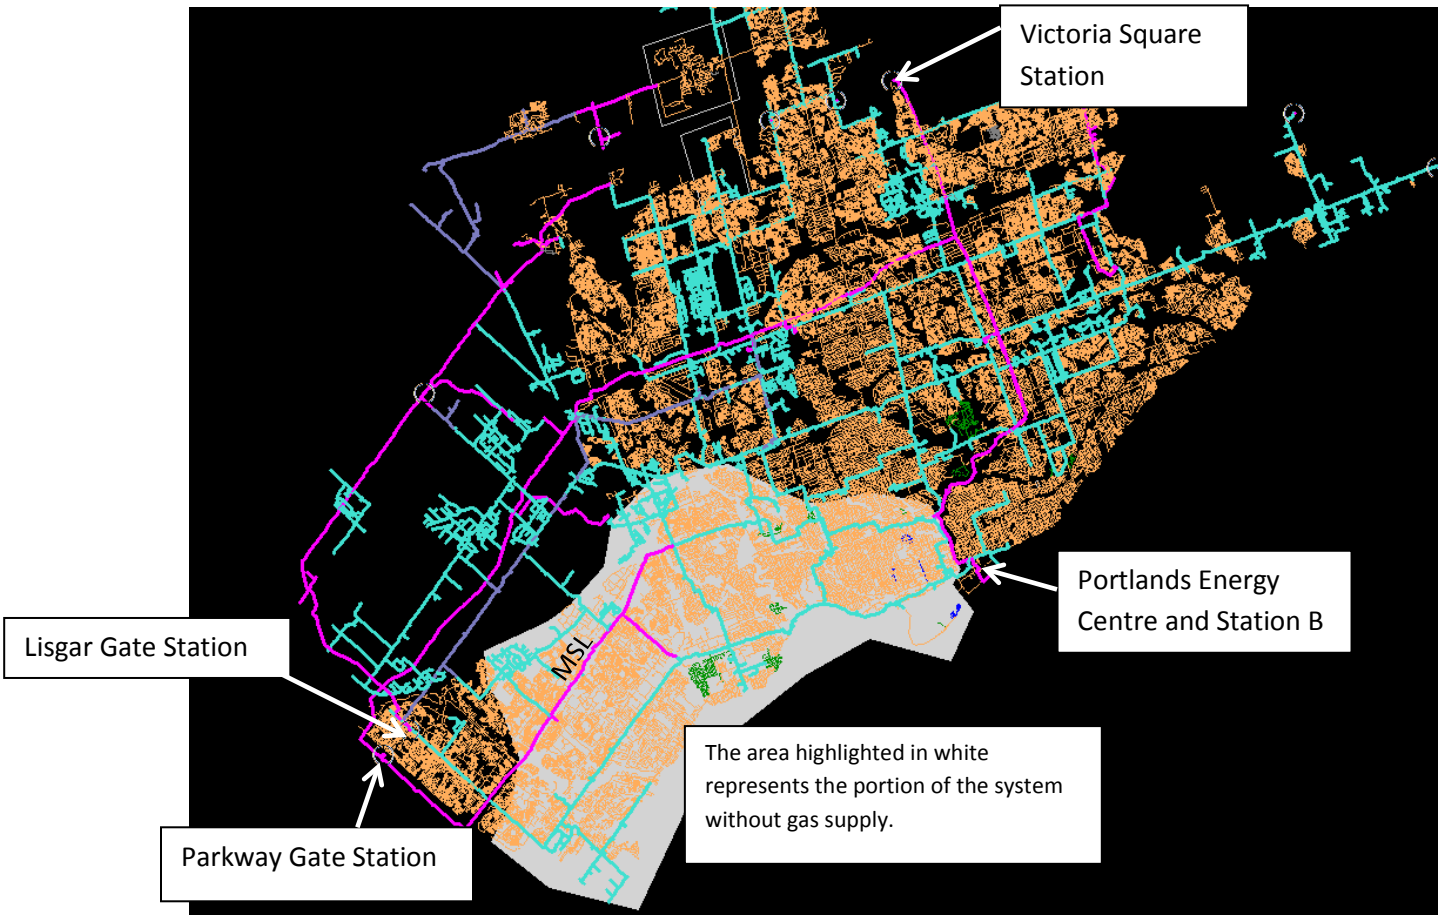
What is the probability of an outage of approximately 270,000 residential customers plus PEC at a 35 DD due to the loss of the Parkway Gate Station? Please provide Enbridge's studies to support its estimate.

RESPONSE

Enbridge has completed a network simulation at a 35DD that considered the loss of the Parkway Gate Station. This includes the loss of the Parkway North Pipeline and the MSL Pipeline. The results of this simulation are shown in Figure 1 on the following page. The estimated customer loss in the white highlighted area is 270,000 which includes downtown Toronto, Etobicoke and most of Mississauga. The highlighted area represents the estimated geographical area that would experience low pressures (please see Figure 1 below). Power generators in those areas would also lose supply. With the loss of supply at Parkway, the system flows are redirected to Lisgar and Victoria Square Stations. These stations are interconnected via the XHP grid, shown as purple in Figure 1 below, and will support much of the system to the north. However, this results in lower pressures on the Don Valley line at Station B, and with no flow on the MSL, the customer loss is concentrated around the MSL pipeline which extends into the downtown core of Toronto.

Witness: E. Naczynski

Figure 1: Estimated area of impact with loss of Parkway Gate Station



Enbridge has not completed a site specific study of Enbridge Parkway Gate Station to determine the probability of loss of this facility. Enbridge does not have details of the probability of loss of facilities relating to the loss of the Union Parkway Station or the loss of the Dawn to Parkway Transmission pipeline, as these facilities are owned and operated by Union.

Union's EB-2012-0433 discusses the reliability of Parkway. Please see Section 8, page 71, paragraph 29 to 30.

Witness: E. Naczynski

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #23

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 3, page 11

According to the Northeast Power Coordinating Council, the probability (or risk) of disconnecting firm load from our electricity system due to resource deficiencies shall be, on average, not more than one day in ten years. [Independent Electricity System Operator, *Ontario Reserve Margin Requirements: 2013-2017*, page 2]

> What is the probability of disconnecting firm load from Enbridge's gas distribution system due to resource deficiencies in the GTA Project Influence Area?

RESPONSE

In the EB-2011-0354 proceeding the Board approved an update to the Design Criteria used by the Company to determine its upstream supply, transportation and storage requirements. For 2014 and beyond the Company will be developing its supply portfolio based on the full implementation of the updated Design Criteria. The updated Design Criteria utilize a recurrence interval of 1 in 5 years. This corresponds to a 20% probability that actual weather conditions will be equal to or greater than design weather conditions in any given year. These design weather conditions are utilized to determine peak day demand.

In responding to this interrogatory the Company is assuming that "resource deficiencies" refers to either a lack of supplies and/or upset conditions related to upstream transportation or storage and/or upset conditions on distribution facilities. Assuming there are no upset conditions on upstream or distribution facilities the probability of not being able to meet demand is 20% in any given year.

Witness: J. Denomy

It should be noted that unsecured supplies and discretionary supplies comprise a large portion of the Company's supply portfolio. Should design conditions occur there is no guarantee that unsecured supplies will be available when required. Should the Tariff amendments requested by TransCanada in its Review & Variance Application with the National Energy Board be approved there is no guarantee that discretionary supplies will be available when required.

Witness: J. Denomy

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #24

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. A, Tab 3, Schedule 4, page 1 & 2

Enbridge's growth forecast relates to the "GTA Project Influence Area." This is described by Enbridge as "the areas of the Enbridge distribution network where growth had a direct impact on the pressures at the current point of minimum system pressure, located at Station B."

a) Please provide a map indicating the detailed boundary of the GTA Project Influence Area.

b) Please describe the boundary of the GTA Project Influence Area using street names and intersections.

c) Assuming that the load growth to be addressed by the proposed facilities were to be instead addressed by targeted DSM (and assuming that this is possible), could that DSM be implemented in any of the 152 smaller geographic areas inside the larger GTA Project Influence Area? For example, would targeted DSM need to be predominantly located in an area nearby to station B or in areas served by proposed segment B?

d) If targeted DSM would need to be located in a sub-area inside the larger GTA Project Influence Area, please:

   i. Provide a map and detailed written description of that DSM sub-area,

   ii. Explain why the project can be justified based on all growth within the GTA Project Influence Area but demand reductions in this same area could not address load growth issues, and

   iii. Provide additional set answers to Environmental Defence's interrogatory numbers 2-15, 17, 25, and 26 based on this DSM sub-area (i.e. with necessary modifications to provide responses with respect to this sub-area rather than the entire GTA Pipeline Project Influence Area.

Witness: E. Naczynski

RESPONSE

a) Please see the Attachment for a map with the boundaries of the GTA Project Influence Area.

b) Please see the Attachment for a map with the boundaries of the GTA Project Influence Area.

c) Enbridge does not believe that targeted DSM can eliminate the need for some or all of the proposed facilities as described in the response to Environmental Defence Interrogatory #20 found at Exhibit I.A4.EGD.ED.20.

d) Enbridge does not believe that targeted DSM can eliminate the need for some or all of the proposed facilities as described in the response to Environmental Defence Interrogatory #20 found at Exhibit I-A4.EGD.ED.20.

RESPONSE

a) The response to a) b) and c) will be answered in aggregate.

Table 1 provides actual peak hour, peak day and annual demands for the GTA Project Influence Area. Actual peak hour data are measured at the gate station and are available back to 2008, whereas peak day demand and annual demands are available back to 2000. Since 2013 is not yet complete annual demand is provided to 2012. Peak hour and peak day data for 2013 assume that peak hour or peak day have already occurred. The data presented in Table 1 are not normalized for design conditions.

Table 1

GTA Project Influence Area	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Peak Hour Demand (TJ)									95.7	96.9	93.0	100.5	88.7	102.6

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #27

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference Ex. A, Tab 3, Schedule 7, pages 1 - 3

Please provide Enbridge's best estimates of the rise in its after-tax net income in each year from 2014 to 2025 (inclusive) if it implemented incremental DSM programs that were sufficient to avoid the need for its proposed new GTA pipelines from a load growth perspective? Please clearly state and show all your assumptions and analyses.

RESPONSE

As per the response to Environmental Defence Interrogatory #14 and #20 found at Exhibit I.A4.EGD.ED.14 and Exhibit I.A4.EGD.ED.20, Enbridge does not believe it is feasible to implement incremental DSM programs to offset the overall need for the GTA Project. The increase in DSM required to offset the load growth component of the GTA Project would impact the overall DSM framework and therefore any calculations of after-tax net income would be speculative at best.

Witnesses: F. Oliver-Glasford
T. MacLean
J. Ramsay

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #28

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference: Ex. C, Tab 2, Schedule 1, Page 1

Please state Enbridge's incremental cost of connecting its system to Union's proposed Parkway West Gate Station (to achieve increased diversity of supply) assuming DSM has eliminated demand growth and hence the need for increased pipeline capacity to meet the needs of customers in the GTA Project Influence Area.

RESPONSE

Cost breakdown information is available only to those who have signed a Declaration and Undertaking as the information is confidential.

It should be noted that even if demand growth is eliminated, there is still the need for the pipeline. Please refer to Exhibit A, Tab 3, Schedule 1 for the purpose and need of the project.

Witness: T. Horton

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #28

ENBRIDGE GAS DISTRIBUTION INC. RESPONSE TO ENVIRONMENTAL DEFENCE INTERROGATORY #29

INTERROGATORY

Issue A4: "What are the alternatives to the proposed facilities? Are any alternatives to the proposed facilities preferable to the proposed facilities?"

Reference Ex. A, Tab 3, Schedule 6

Please provide Enbridge's best estimates of the rise in its after-tax net income in each year from 2014 to 2025 inclusive if the OEB approves its proposed GTA pipeline project. Please clearly state and show all your assumptions and analyses.

RESPONSE

The current estimates of the 2015-2025[1] net income amounts associated with the proposed GTA Project are shown within the attached table[2]. The projected earnings amounts include an assumed 36% equity level of forecast rate base amounts with an allowed Return on Equity equivalent to the 2013 Board approved ROE % of 8.93%.

[1] The GTA Project is planned to be in service in 2015, therefore the net income amount in 2014 is not applicable.
[2] For reasons described in interrogatory response I.D5.EGD.Staff.48, the net income amounts assume Segment A's Bram West to Albion is a 36" pipeline.

Witness: K. Culbert

Enbridge Gas Distribution GTA Project assumed earnings impacts

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Rate Base (A)	$ 113,621,514	$ 543,728,240	$ 527,457,354	$ 511,186,371	$ 494,915,292	$ 478,644,117	$ 462,874,907	$ 447,087,923	$ 430,781,104	$ 414,474,199	$ 398,167,218
Common Equity (B)	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%	36.00%
Allowed Return on Equity (C)	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%	8.93%
Earnings (A x B x C)	$ 3,652,704	$ 17,479,775	$ 16,956,699	$ 16,433,619	$ 15,910,537	$ 15,387,451	$ 14,880,503	$ 14,372,983	$ 13,848,751	$ 13,324,517	$ 12,800,280

Notes; 1) Using data which assumes Segment A's Bram West to Albion is a 36" pipeline.
2) Using the 2013 OEB approved ROE% for approximating purposes.
