1 **1 OVERVIEW**

2 The Ontario Power Authority (“OPA”) was merged with the Independent Electricity
3 System Operator (“IESO”) effective January 1, 2015. An issue to be considered as a
4 result of the merger is the development of the usage fee that will be adopted for
5 recovering the revenue requirement of the new IESO.

6 The IESO has retained Elenchus Research Associates, Inc. (“Elenchus”) to review the
7 design of the existing OPA and IESO usage fees which were designed to recover the
8 revenue requirements of the separate organizations and to examine options for
9 recovering the revenue requirement of the new IESO.

10 Both entities previously recovered their OEB regulated revenue requirements primarily
11 through usage fees that were charged on an energy (i.e., per MWh) basis. Although the
12 same billing factor was used by the two agencies, the usage fees differ in two important
13 respects.

- 14 • The existing IESO usage fee is charged on a gross load basis (i.e., including load
15 served by generation that is embedded in the Ontario distribution system),
16 whereas the OPA usage fee is charged on the basis of net load.
- 17 • The existing IESO usage fee is charged to both domestic and export customers,
18 whereas the existing OPA usage fee is charged only to domestic customers.¹

19 Section 2 of this evidence reviews the relevant Ontario Energy Board (“OEB”) decisions,
20 highlighting the basis of the differences in the design of the existing usage fees.

21 Section 3 discusses the gross versus net billing issue and recommends that the new
22 IESO fee should be billed on the basis of gross load. The reasoning that supported the
23 change from net to gross billing for the former IESO usage fee in EB-2013-0381 is
24 equally applicable to the portion of the new IESO revenue requirement that corresponds

¹ The terms domestic and export customers are generally used to refer to what might be described more accurately as domestic and export energy volumes. Some market participants are billed for both domestic and export volumes and are, in effect, both domestic and export customers of the IESO. Elenchus has retained this terminology for consistency with the terminology of past proceedings.

1 to costs that were previously included in the OPA revenue requirement. The OPA may
2 well have adopted the IESO's approach and re-established consistency between the
3 usage fees of the two agencies if they had not been merged.

4 It is therefore recommended that the 2016 IESO usage fee be billed on the basis of
5 AQEW + SQEW + EG as defined in section 3.

6 Section 4 discusses two options for addressing the difference between the two usage
7 fees in terms of their applicability to export customers. The options are:

- 8 1. treat all customers as a single class with a common usage fee; or
- 9 2. define two customer classes (domestic and export) that would pay different
10 usage fees.

11 The key considerations in assessing these options are the principles of administrative
12 simplicity and equity, where equity is indicated by the level of the actual or implicit
13 revenue-to-cost ratios of the classes under each option.

14 With respect to the justification for differentiating the usage fee that is applied to
15 domestic and export customers, it is noted that the revenue to cost ratios for the
16 separate classes if a single usage fee is adopted would be 97.88% and 119.32% for the
17 domestic and export classes, respectively. Using a revenue-to-cost ratio range of 80%
18 to 120%, which is the Board-approved range for the rates of most distribution customer
19 classes, it can be concluded that the uniform rate would be deemed to be equitable for
20 both classes of customers. Rates within a Board approved range are not considered to
21 be either under-collecting or over-collecting the causal costs related to a customer
22 class, given the degree of uncertainty inherent in cost allocation and the degree of
23 judgment required to accommodate other ratemaking principles.

24 Section 5 provides an overview of the cost allocation model that has been developed by
25 Elenchus as a basis for determining the causal costs associated with domestic and
26 export customers. Section 6 contains the report's conclusions and recommendations.

27 This report updates the version dated 18 January 2016 which contained revenue to cost
28 ratio results based on the IESO's 2015 financial information.

1 **2 BACKGROUND**

2 **2.1 THE CURRENT OPA USAGE FEE**

3 The OPA’s last approved usage fee of \$0.439/MWh has been in effect since January 1,
 4 2014. It was approved by the OEB in Decision and Order EB-2013-0326 dated
 5 November 6, 2014.² The 2014 usage fee was reduced from the usage fee of
 6 \$0.551/MWh which had been in effect since January 1, 2010.³ The OPA’s usage fee
 7 continues to be collected on the basis of the net energy withdrawals, which excludes
 8 embedded generation.

9 The OPA usage fee is not charged to export customers. In its 2011 fees application,
 10 EB-2010-0279, the OPA sought OEB approval to recover its usage fees from export
 11 customers in addition to Ontario customers. This proposal was not accepted by the
 12 OEB. The OEB’s reasons for not approving this change were set out in its July 8, 2011
 13 Decision and Order. The reasons indicated that further analysis and consultation would
 14 be required to support a usage fee that would be appropriate for export customers.

15 ***Board Findings***

16 *The Board will not approve the OPA’s proposal to recover the 2011 usage fee from*
 17 *export customers for a number of reasons.*

18 *First, the Board is of the view that the mandate of the OPA is not comparable to that*
 19 *of the IESO. Even the most cursory examination of the relevant sections of the*
 20 *Electricity Act is illustrative of the distinct nature of the two organizations. Section*
 21 *5(1)(e) of the Electricity Act, which sets out the objects of the IESO, clearly states*
 22 *that the IESO is to work with the responsible authorities outside Ontario to co-*
 23 *ordinate the IESO’s activities with their activities. In contrast, section 25.2(1) which*
 24 *is the section of the Electricity Act that describes the objects of the OPA, expresses*
 25 *the OPA’s fundamental responsibilities as being “for Ontario” and “in Ontario”.*

26 *Second, the Board is not convinced that, in executing its objectives pursuant to the*
 27 *Electricity Act that the OPA creates benefits for export customers in the manner*
 28 *asserted by the parties supporting the extension of the fee to exporters. In*
 29 *particular, by engaging in power system planning that meets the reliability and self-*
 30 *sufficiency goals of the government of Ontario, the OPA’s activities have the*

² The OEB also approved in Decision and Order EB-2013-0326 the OPA’s proposal to hold its other fees, for registrations and applications, constant.

³ The OPA’s 2010 usage fee was approved in Decision and Order EB-2009-0347 dated April 27, 2010.

1 *consequence of creating potential export capability. It does not necessarily follow*
2 *that this “unintended” consequence is a benefit for which exporters should pay. The*
3 *Board is also reticent to create the linkage that necessarily follows this argument,*
4 *which is because exporters “pay for this benefit” the OPA is obligated to engage in*
5 *system planning in a manner that ensures export capability exists.*

6 *Third, the Board agrees with the submissions of parties that the proposed fee has*
7 *not been supported by empirical evidence. The OPA proposal rests primarily on the*
8 *IESO example, and a rather cursory benefits analysis. The extension of fees to*
9 *market participants should generally be conducted on a firm empirical and*
10 *principled basis. There is no such basis in the evidence before the Board. In this*
11 *case, if the OPA intends to reintroduce this approach in this or a future expenditure*
12 *and revenue requirement and fees case, it should be prepared to demonstrate a*
13 *coherent rationale, quite possibly based on an allocation study, as suggested by Mr.*
14 *Todd from Elenchus.*

15 *Finally, the Board notes that the OPA did not undertake any meaningful or*
16 *substantive consultation with stakeholders regarding this proposal. Should the*
17 *OPA choose to re-introduce this approach now or in the future, the Board expects*
18 *the OPA to have engaged the stakeholder community in a relevant and substantive*
19 *manner and will require that evidence of this consultation be filed in conjunction with*
20 *the associated revenue requirement and fees application.⁴*

21 As the OEB’s Decision and Order notes⁵, the proposed change would have made the
22 OPA’s cost recovery consistent with the IESO’s cost recovery which was, and continues
23 to be, from domestic and export customers.

24 **2.2 THE CURRENT IESO USAGE FEE**

25 The IESO’s 2014 usage fee of \$0.803/MWh has been in effect since January 1, 2014. It
26 was approved by the OEB in Decision and Order EB-2013-0381 dated May 22, 2014.⁶
27 The 2014 usage fee was a reduction from the interim usage fee of \$0.822/MWh for
28 2012 and 2013 which was made firm by Decision and Order EB-2013-0381.⁷ The
29 IESO’s usage fee is charged to both domestic and export customers.

⁴ Ontario Energy Board, Decision and Order, EB-2010-0279, pages 16-17.

⁵ Ibid, page 15.

⁶ The OEB also approved in Decision and Order EB-2013-0381 the continuation of the IESO’s \$1000 application fee.

⁷ The OPA’s 2010 usage fee was approved in Decision and Order EB-2009-0347 dated April 27, 2010.

1 The OEB also approved the IESO’s proposal to calculate its 2014 usage fee based on
 2 total energy withdrawals, including an amount equal to the output from embedded
 3 generation. In its Decision and Order, the OEB noted that:

4 *Currently, distributors collect IESO usage fees from all of their customers based on*
 5 *their total loads but then only remit to the IESO based on the distributor net load*
 6 *which is reduced by embedded generation. The amount of embedded generation is*
 7 *expected to continue to increase in materiality. The IESO submits that the proposed*
 8 *change in methodology more fairly reflects the changing nature of the grid, including*
 9 *the need for the IESO to establish and maintain visibility of embedded generation*
 10 *and to forecast its impact on bulk system requirements.*⁸

11 In contrast, as noted above, the OPA’s usage fee continues to be collected on the basis
 12 of the net energy withdrawals, excluding the output from embedded generation.

13 **2.3 INTEGRATING THE FORMER OPA AND IESO USAGE FEES**

14 In light of the merger of the IESO and the OPA, it is appropriate to consider merging the
 15 two usage fees into a single fee schedule. Given the differences between the two usage
 16 fees identified above, it is necessary to address the appropriate approach to dealing
 17 with the identified differences. Specifically, in this report consideration is given to
 18 whether the OPA portion of the new IESO fee should be:

- 19 • charged on the basis of net load or on the basis of gross load which would
- 20 facilitate the adoption of a single usage fee for the new IESO, and
- 21 • charged to export customers in whole or in part, and if in part, how the usage fee
- 22 differential for domestic and export customers should be determined.

23 It is evident that a fully integrated IESO usage fee would avoid complexity. However, it
 24 is also evident that a fully integrated usage fee would shift responsibility for the IESO
 25 costs among market participants and end use customers. The key consideration is
 26 whether a fully integrated usage fee would result in equitable treatment among the
 27 various types of customers that benefit from the restructured IESO role in the Ontario
 28 electricity market.

29 These issues are examined in sections 3 and 4.

⁸ Ontario Energy Board, Decision and Order, EB-2013-0381, page 3.

1 2.4 ADDITIONAL ISSUES RELATED TO RECOVERING ADMINISTRATIVE COSTS

2 The assignment given to Elenchus by the IESO was to develop a cost allocation model
3 that would allocate the IESO's costs in a manner consistent with standard regulatory
4 cost allocation principles and practices, in particular the principle of cost causality. In
5 conducting this work, Elenchus has observed that the IESO's costs that are recovered
6 through its Usage Fee consist largely of costs that would be treated as operational
7 overhead or administrative and general (A&G) costs in the cost allocation models that
8 are typically used by regulated electric utilities for their rate setting processes.

9 These costs are not viewed as costs that are directly caused by customers in the
10 process of providing service. The causal relationship is far less direct than the capacity
11 of a distribution system or the customer service support provided by a call centre. As a
12 result, A&G costs are commonly allocated essentially as an overhead to other operating
13 and capital costs that are caused more directly by customers.

14 The NARUC Electric Utility Cost Allocation Manual⁹ discusses Classification and
15 Allocation of Common and General Plant Investments and Administrative and General
16 Expenses in Chapter 8, a three-page chapter. The discussion of A&G expenses states:

17 *Administrative and general expenses include Accounts 920 through 935 and are*
18 *allocated with an approach similar to that utilized for general plant. One*
19 *methodology, the two-factor approach, allocates the administrative and general*
20 *expense accounts on the basis of the sum of the other operating and maintenance*
21 *expenses (excluding fuel and purchased power).*

22 *A more detailed methodology classifies the administrative and general expense*
23 *accounts into three major components: those that are labor related; those which are*
24 *plant related; and those which require special analysis for assignment or the*
25 *application of the beneficiality criteria for assignment.*

26 The IESO has no "other operating and maintenance expenses" to use as a basis for
27 deriving cost factors for the A&G allocation. However, if the Ontario electricity system
28 were examined on a holistic basis, analogous to an integrated utility which is the implicit
29 model addressed by the NARUC Manual, the IESO's A&G cost could be allocated on
30 the basis of allocation factors that correspond to the allocation of other O&M costs.

⁹ National Association of Regulatory Utility Commissioners (January 1992) *Electric Utility Cost Allocation Manual*.

1 Given that the model we have developed does not include those other system O&M
 2 costs, we have allocated the IESO's costs to the domestic and export classes based on
 3 a presumed causal relationship for departments that are directly involved in operating
 4 the market. Support functions for these departments are then allocated in a manner
 5 similar to the usual treatment of A&G costs as outlined in the NARUC Manual.

6 Elenchus acknowledges that this approach is somewhat non-standard and as a result
 7 the revenue-to-cost ratios that are calculated may not be as indicative of a true causal
 8 relationship as can be achieved in the typical utility cost allocation model. However, we
 9 believe that the results are the best indicator available for allocating costs in a manner
 10 consistent with the IESO's existing MWh based Usage Fee. Alternate fee designs
 11 would require quite different approaches to allocating the IESO's costs.

12 **3 CHARGING THE NEW IESO FEE BASED ON GROSS LOAD**

13 The rationale for collecting the former IESO usage fee on the basis of total energy
 14 withdrawals, including an amount equal to the output from embedded generation, was
 15 presented in my evidence that was included in the material filed by the IESO in support
 16 of its 2014 fees application.¹⁰ The essence of the rationale appears in the Conclusion
 17 and Recommendation section of that evidence.

18 **5. Conclusion and Recommendation**

19 *It is recommended that the billing determinant for the IESO fee be changed from*
 20 *net to gross billing. The gross billing approach would be implemented by using as*
 21 *the charge determinant for AQEW+SQEW plus the embedded generation reported*
 22 *by distributors to the IESO on a monthly basis.*

23 *The recommended approach would be more equitable in that all customers would*
 24 *then pay the same effective rate for the IESO administration fee, regardless of the*
 25 *proportion of embedded generation within the service territory of their distributor.*
 26 *While the dollar value of the existing inequity is relatively small, the cost of*
 27 *correcting the inequity is immaterial; hence, cost is not an impediment to adopting*
 28 *the change.*

¹⁰ [EB-2013-0381, Exhibit B, Tab 4, Schedule 1](#) (Review of IESO Fees Billing Determinant, Evidence of John Todd, October 2013)

1 *The proposed change in the billing determinant is independent of the changes in*
 2 *the IESO's revenue requirement and volume forecast; hence it is revenue neutral*
 3 *for both electricity consumers and LDCs. From the perspective of the IESO, the*
 4 *impact of the proposed change in the billing determinant is that there will be a lower*
 5 *charge that is applied to a larger volume with the total revenue being unchanged.*
 6 *From the LDCs perspective, they will recover from customers only the amount*
 7 *remitted for the IESO Administration Fee; hence, the variances between the*
 8 *amount paid to the IESO and the amount collected from customers will be reduced.*
 9 *As a result, the amounts flowing into account 1580 (RVSA_{WMS}) related to an over-*
 10 *collection of the fee will be reduced.*

11 *The only stakeholders financially impacted by the proposed change will be the end-*
 12 *use customers who will all pay the same effective kWh-based fee if the change is*
 13 *implemented, rather than paying an effective rate that is affected by the amount of*
 14 *embedded generation in their LDC's service area. The average effective fee paid by*
 15 *customers will not change, although customers served by LDCs with above*
 16 *average embedded generation as a percentage of load will experience a slight*
 17 *increase in the effective fee they pay since they currently pay less than the average*
 18 *fee, while those served by LDCs with comparatively less embedded generation will*
 19 *pay a slightly lower effective rate, since they are currently paying an above average*
 20 *effective rate.*

21 In my opinion, the rationale for including embedded generation in the charge
 22 determinant for the IESO's 2016 usage fees applies equally to both the former OPA
 23 component of the new IESO charge and the former IESO component. In particular:

- 24 • charging on the basis of net load is an historical anomaly in both cases, with the
 25 original implementation having taken place at a time when there was very little
 26 embedded generation;
- 27 • at the time charging on the basis of net load was introduced, neither the IESO
 28 nor the OPA had access to reliable information on embedded generation;
- 29 • the inconsistency between the basis on which distributors collect the usage fees
 30 from customers (gross load) and the payment to the IESO prior to 2014 and to
 31 the OPA since its inception (net load) is the same in both cases; and
- 32 • the impact of a change for the OPA portion of the usage fee would be essentially
 33 the same as the impacts previously identified in the case of the IESO.

1 Furthermore, for the newly merged entity, it will be administratively simpler as well as
 2 more understandable to all affected parties if the billing determinant used for the entire
 3 new IESO usage fee is consistent.

4 The most appropriate approach to developing the IESO usage fee for 2016 would be to
 5 charge it on the basis a single charge determinant. That is, the 2016 net revenue
 6 requirement for the IESO would be recovered by charging all domestic and export
 7 customers (i.e., market participants) a fee based on a charge determinant defined as
 8 $AQEW + SQEW + EG$, where:

- 9 • AQEW is the allocated quantity of energy withdrawn from the IESO-controlled
 10 grid;
- 11 • SQEW is the scheduled quantity of exports withdrawn from the IESO-controlled
 12 grid; and
- 13 • EG is the embedded generation reported by distributors to the IESO on a
 14 monthly basis.

15 **4 CHARGING THE NEW IESO FEE TO EXPORT CUSTOMERS**

16 Two rate design options for the 2016 IESO usage fee would be consistent with past
 17 OEB decisions on the OPA and IESO fees.

18 **Option #1:** One standard fee to be charged to all domestic and export customers

19 **Option #2:** Separate usage fees for domestic and export customers that reflect
 20 differences in their allocated costs

21 **4.1 A SINGLE STANDARD USAGE FEE FOR DOMESTIC AND EXPORT CUSTOMERS**

22 In light of the concerns raised previously with respect to charging the OPA fee to export
 23 customers, it is evident that implementing a single standard IESO fee for domestic and
 24 export customers would be inequitable if it resulted in a level of cost recovery from
 25 export customers that is not consistent with cost causality principles. With respect to the
 26 OPA portion of the merged revenue requirement, this approach would implicitly

1 implement the methodology that was not accepted by the OEB when it was proposed by
2 the OPA in its 2011 fees application, EB-2010-0279.

3 Based on the OEB's Decision and Order in that proceeding, which is quoted above, it
4 would not be appropriate for this approach to be implemented unless it can be shown
5 analytically that there is not a significant difference in the causal costs associated with
6 domestic and export customers if viewed as distinct customer classes. The analysis
7 contained in section 4.3 addresses this concern.

8 **4.2 TWO CUSTOMER CLASSES WITH A DIFFERENTIATED USAGE FEE**

9 Consistent with the issues addressed in OEB Decision and Order EB-2010-0279, an
10 option for the new IESO usage fee would be to establish separate usage fees for
11 domestic and export customers based on their fully allocated costs. This approach
12 would be similar to the standard rate setting process used by OEB-regulated distributors
13 for determining the rates for their customer classes.

14 **4.3 ANALYSIS OF THE STANDARD VS DIFFERENTIATED FEE OPTIONS**

15 Elenchus has developed a cost allocation model for the IESO that treats domestic and
16 export customers as two customer classes and allocates the total revenue requirement
17 of the merged IESO to those classes using a fully allocated costing methodology. This
18 IESO cost allocation model is methodologically consistent with the OEB-approved
19 model that allocates the costs of electricity distributors to their customer classes. The
20 model is described in section 5, below.

21 The results of this cost allocation methodology using the IESO's 2016 budget are
22 presented in Table 1 which shows the allocated cost of each potential "class" of service
23 (Domestic and Export if separate classes are established and Combined if there is a
24 single usage fee). The table also shows the corresponding MWh of each class based on
25 the proposed billing determinant described in section 3 (i.e., AQEW + SQEW + EG).
26 The Class-Specific Usage Fees column shows the rates that would correspond to each
27 class having a revenue-to-cost (R/C) ratio of 100% along with the rates that would result
28 in R/C ratios of 80% to 120%. The Common Usage Fee column shows the revenue-to-

1 cost ratios that would result if a single standard rate per MWh were used for both
 2 domestic and export customers.

3 **Table 1: Usage Fees and Revenue-to-Cost Ratios for Domestic, Export and**
 4 **Combined Customer Classes, with Different and Common Usage Fees**

	Allocated Costs	MWh	Class-Specific Usage Fees			Common Usage Fee	
			100% RCR	80% RCR	120% RCR	Rate	R/C Ratio
Domestic	\$164,124,456	140,190,875	\$ 1.1707	\$ 0.9366	\$ 1.4049	\$1.1459	97.88%
Export	\$18,007,515	18,751,536	\$ 0.9603	\$ 0.7683	\$ 1.1524	\$1.1459	119.32%
Combined	\$182,131,970	158,942,411	\$ 1.1459			\$1.1459	100.00%

5 A central consideration in assessing whether it is equitable to treat two groups of
 6 customers that are distinguishable, such as domestic and export customers, as a single
 7 class for rate setting purposes is whether the rates that they would be charged if they
 8 are separate classes differ significantly from the uniform rate. If their rates would not
 9 differ significantly, treating them as separate classes would result in unnecessary
 10 complexity in the rate setting process and in the resulting rate structure. The standard
 11 approach to assessing rate equity is on the basis of revenue-to-cost (R/C) ratios.

12 The range of acceptable R/C ratios for electricity distributors is set out in the OEB's
 13 March 31, 2011 Report, on Cost Allocation, section 2.9.4. Table 1 (page 36) of that
 14 Report sets out the acceptable ranges by customer class. The Report's table is
 15 replicated below.

16 If the OEB were to adopt an R/C ratio range of 80% to 120% for the IESO's usage fee, it
 17 would follow that a single standard usage fee (\$1.1459) would be considered equitable
 18 if it is within the range bracketed by the 80% and 120% R/C ratio for each class. As
 19 Table 1 shows, the standard usage fee is within this range for both classes.

1

Table 2: Revenue-to-Cost Ratio Ranges

SERVICE CLASS	RANGE
Residential	85 to 115%
General Service < 50 kW	80 to 120%
General Service 50 to 4,999 kW	80 to 120%
Large User	85 to 115%
Unmetered Scattered Load	80 to 120%
Street Lighting	70 to 120% ¹¹
Sentinel Lighting	80 to 120%

2 Another way to look at this issue is to determine the R/C ratio of the classes if both are
 3 charged the same rate. The “Rate” column under the “Common Usage Fee” heading in
 4 Table 1 is determined by dividing the total revenue requirement of the IESO by the
 5 billing determinant for the combined class (i.e., the total MWh of domestic plus export
 6 customers). The R/C ratio values are determined by dividing the revenue of each class
 7 (Rate x MWh) by their allocated costs. If the resulting R/C ratios are equitable, it would
 8 lend support to treating domestic and export customers as a single class and charging a
 9 uniform usage fee to all customers. On the other hand, if either R/C ratio is outside of
 10 the OEB-approved range, then it may justify establishing separate domestic and export
 11 classes for purposes of the IESO usage fee.

12 A decision on whether to establish separate domestic and export rate classes may also
 13 involve balancing the goal of equity with other objectives such as simplicity and the cost
 14 of supporting a more complex rate structure. In particular, if the dollar impact on any
 15 group of customers is small, it may justify adopting a single usage fee for all customers
 16 despite R/C ratios that might otherwise be considered inequitable.

¹¹ In addition, in the Board’s recent Review of Cost Allocation Policy for Unmetered Loads OEB File No. EB-2012-0383, the revenue-to-cost ratio for the Street Lighting Class was changed to 80% to 120%. See Issuance of New Cost Allocation Policy for Street Lighting Rate Class dated June 12, 2015.

1 **5 OVERVIEW OF THE IESO COST ALLOCATION MODEL**

2 The cost allocation model that Elenchus has developed for the IESO is based on cost
3 causality and follows the traditional three steps of a cost allocation methodology.

4 Based on interviews with IESO staff to determine the activities performed by all
5 departments, Elenchus undertook a functional-classification of the IESO's revenue
6 requirement based on how each identified function is performed for (i) the exclusive
7 benefit of domestic customers, (ii) the exclusive benefit of export customers, or (iii) for
8 the benefit of both domestic and export customers.

9 The functionally-classified costs are allocated to two "customer classes", or types of
10 service: domestic and export. These classes are analogous to the customer classes
11 served by distributors in that they are easily identifiable and "cause", or benefit from, the
12 transmission system and therefore the activities/services of the IESO in different ways.
13 For purposes of determining cost causality, the domestic class can be thought of as the
14 in-province end-use customers who ultimately pay the IESO usage fee that is embedded
15 in their monthly bills.

16 The IESO's 2016 forecast revenue requirement and 2015 year-end assets were used
17 as the basis for the cost allocation model presented in this updated evidence.

18 **5.1 FUNCTIONAL-CATEGORIZATION¹²**

19 Consistent with the previous evidence dated 15 January 2016, the IESO's expenses
20 have been functionally-categorized by business unit and department (the top two levels
21 of the organizational management structure). Using this approach, the IESO's
22 accounting data can be incorporated directly into the cost allocation model.
23 Departments are functionally-categorized based on the function they perform so that
24 costs can be allocated based on the classes that cause those costs to be incurred.

¹² The classification/categorization step, that is normally used in cost allocation models for integrated or distribution utilities (e.g., demand-related, energy-related and customer-related) is not relevant in the case of the IESO. The functionalization and classification/categorization steps have been combined to identify cost categories that are then allocated using the identified allocators.

1 The following seven business units account for most of the IESO's costs:

- 2 • Market and Resource Development
- 3 • Conservation and Corporate Relations
- 4 • Information and Technology Services
- 5 • Planning, Law, and Aboriginal Relations
- 6 • Corporate Services
- 7 • Market and System Operations
- 8 • Market Assessment and Compliance Division ("MACD")

9 The remaining costs require additional functional-classes to be identified for cost
10 allocation purposes:

- 11 • CEO (Office, NERC Membership, Audit)
- 12 • Others (Amortization, Interest, Uncleared Salary)

13 Each department within each business unit was identified as a separate functional-
14 category. Descriptions of the functions performed by each department are provided
15 below, along with each department's 2016 budget figure and the allocator used for
16 allocating its costs. The allocators are described in section 5.2. The details are also
17 summarized in the Allocation Detail Worksheet that appears as Appendix A.

18 **5.1.1 CEO (OFFICE, NERC MEMBERSHIP, AUDIT)**

19 ***CEO Office***

20 The CEO's Office provides overall management of the IESO.

21 Budget: \$1,189,152

22 Allocation method: Total Other OM&A

23 ***NERC Membership***

24 The Electricity Act sets the IESO's objectives including Object 6 (d) which requires
25 participation in the development by any standards authority of criteria and standards
26 relating to the reliability of the integrated power system. The Act defines a "standards

1 authority” as the North American Electric Reliability Corporation or any successor
2 thereof, or any other agency designated by regulation that approves standards or
3 criteria applicable in and outside Ontario for the reliability of transmission systems.

4 Budget: \$3,976,613

5 Allocation method: 50:50 split between domestic and export

6 ***Internal Audit***

7 Internal Audit (IA) provides independent, objective assurance and consulting services
8 designed to add value and improve the IESO operations. IA contributes towards the
9 accomplishment of the IESO objectives by bringing a systematic, disciplined approach
10 to evaluate and improve the effectiveness of risk management, control and governance
11 processes throughout the organization

12 Budget: \$1,638,709

13 Allocation method: Total Other OM&A

14 **5.1.2 MARKET AND SYSTEM OPERATIONS**

15 Market and System Operations is responsible for the operational planning and
16 assessment functions, managing the short-term operation of Ontario's competitive
17 wholesale electricity market, and directing the operation of the IESO-controlled grid. It is
18 organized in two divisions - Power System Assessments and Market Operations with
19 three departments each. A seventh department reports directly to the VP, Operations
20 Change Initiatives. The three departments of Power System Assessments are System
21 Performance, Reliability Assessments, and Connections and Registrations. The three
22 departments of Market Operations are Operational Effectiveness, System Operations,
23 and Market Forecast and Integration.

24 ***Vice President Office***

25 The VP's Office provides overall management of the business unit.

26 Budget: \$1,588,319

27 Allocation method: Sum of allocated costs of the department

1 ***System Performance***

2 System Performance provides a large variety of power system analysis services, most
3 notably the operating security limits used in all operational timeframes. System
4 Performance also develops and maintains the online and offline system models and
5 tools used in power system analysis studies.

6 Budget: \$5,599,744

7 Allocation method: Domestic and export in proportion to energy (TWh)

8 ***Reliability Assessments***

9 Reliability Assessments is responsible to meet the IESO's NERC and NPCC reliability
10 standard obligation for mid to long-term reliability assessments. This includes demand
11 forecasts, resource adequacy assessments and performing system-wide transmission
12 assessments. Although these activities relate directly to NERC and NPCC membership
13 requirements, they also ensure overall system reliability for domestic customers.

14 Budget: \$3,282,505

15 Allocation method: Domestic and export in proportion to energy (TWh)

16 ***Connections and Registrations***

17 Connections & Registrations performs reliability assessments, performance validation
18 and registration activities for all new and modified connections that connect to the IESO
19 Controlled Grid and/or participate in the IESO Administered Markets.

20 Budget: \$4,441,271

21 Allocation method: Domestic and export in proportion to energy (TWh)

22 ***Operational Effectiveness***

23 Operational Effectiveness assesses power system events, develops processes and
24 documentation for executing tasks in Market Operations, supports Market and System
25 Operations compliance with reliability standards, maintains Operating Agreements with
26 Ontario transmitters and neighboring system operators, maintains ancillary service
27 contracts with market participants and prepares power system emergency plans.

1 Budget: \$3,876,907

2 Allocation method: Domestic and export in proportion to energy (TWh)

3 ***System Operations***

4 System Operations Department (SOD) is responsible for real-time operations. SOD staff
5 direct the reliable operations of the Ontario power system within system capabilities,
6 and operate the Ontario electricity market to efficiently select resources (both
7 generation and dispatchable load resources within Ontario plus economic imports from
8 and exports to neighboring jurisdictions) to balance supply and demand and prepare
9 data – including market prices and resource schedules – for settlement.

10 Budget: \$11,499,273

11 Allocation method: Domestic and export in proportion to energy (TWh)

12 ***Market Forecast and Integration***

13 Market Forecasts and Integration (MFI) is responsible for the period 2-30 days in
14 advance of each trade date. MFI staff assesses and approve Market Participant
15 requests to remove equipment from service for maintenance (~15,000 requests
16 annually), assess near-term resource adequacy requirements and publish reports
17 detailing the state of the power system, allowing market participants to plan their
18 operations. Each day MFI staff also prepare the daily Operating Plan to be executed by
19 System Operations for the next day's operation, which includes forecasts of electricity
20 demand and the output of variable generators in the province (both wind and solar), and
21 a schedule of resources committed to satisfy next day electricity demand. MFI staff also
22 delivers an extensive amount of training within Market Operations to on-board new staff
23 and to provide continuing education, allowing Market Operations to meet requirements
24 of reliability standards bodies.

25 Budget: \$2,662,253

26 Allocation method: Domestic and export in proportion to energy (TWh)

1 ***Operations Change Initiatives***

2 Operations Change Initiatives is a project management office leading and supporting
3 change initiatives impacting the business unit and liaising with other business units on
4 capital programs and business planning.

5 Budget: \$1,184,258

6 Allocation method: Domestic and export in proportion to energy (TWh)

7 **5.1.3 MARKET AND RESOURCE DEVELOPMENT**

8 ***Vice President Office***

9 The VP's Office provides overall management of the business unit.

10 Budget: \$1,224,063

11 Allocation method: Sum of allocated costs of the department

12 ***Contract Management***

13 The Contract Management group is responsible for managing contracts resulting from
14 the IESO's electricity supply procurements, as well as demand-side management and
15 load management initiatives. As of Q2 2015, the IESO had approximately 23,217 MW of
16 electricity supply capacity under contract. This group is responsible for the fulfillment of
17 the IESO's obligations under these contracts, including financial settlement,
18 enforcement of supplier's obligations under these procurement contracts, data
19 collection, analysis and reporting on the contracts. This group also manages the various
20 energy support programs under the Green Energy and Green Economy Act, 2009.

21 Budget: \$9,101,459

22 Allocation method: Domestic class only

23 ***Renewables Procurement***

24 The Renewables Procurement group is responsible for procuring electricity supply from
25 renewable resources undertaken in response to directives received from the Minister of
26 Energy. The group provides analysis and policy advice to the government, designs,

1 implements, and executes procurement programs and initiatives, and interacts with
2 stakeholders for all renewable generation technologies as well as energy storage. A key
3 focus of the group continues to be the design and administration of the FIT and
4 microFIT programs. However, the group is also responsible for other procurement
5 activities, such as the design and implementation of competitive procurements (e.g.,
6 Large Renewable Procurement), and the negotiation of bilateral contracts for renewable
7 energy, including opportunities to secure renewable generation from other jurisdictions.

8 Budget: \$3,477,961

9 Allocation method: Domestic class only

10 ***Clean Energy Procurement***

11 The Clean Energy Procurement group is responsible for procuring supply from clean
12 energy resources undertaken in response to directives from the Minister of Energy. The
13 group's primary focus is the design and implementation of procurements for natural gas-
14 fired generation, including combined-cycle, simple-cycle, and combined heat and power
15 ("CHP"). Procurements also include supply from other sources, such as energy
16 recovery projects, energy from waste ("EFW") projects, coal-fired facilities converted to
17 natural gas, and the procurement of load management services. Clean Energy
18 Procurement also provides strategic, analytical and research support to groups within
19 the Market and Resource Development as well as at the organizational level.

20 Budget: \$1,910,054

21 Allocation method: Domestic class only

22 ***Policy and Analysis***

23 This group has merged with the Clean Energy Procurement and Contract Management
24 groups. Consequently, it does not appear as a separate functional-category in the
25 updated 2016 cost allocation model.

26 ***Markets***

27 The Markets group is responsible for the development of the IESO administered
28 markets (IAM) and supports the advancement of sector policies that promote the IESO's

1 market principles. The IAM includes participation from dispatchable and non-
2 dispatchable generation and loads, as well as traders importing and exporting power on
3 the interties. The primary focus of the group is to improve the ability of the IAM to deliver
4 system reliability efficiently, by encouraging competition, innovation and enabling
5 informed decisions by all participants through transparent and efficient price signals.
6 The group works with internal and external stakeholders in the development of potential
7 changes and through the market rule amendment process that governs market design
8 and participation. The group also provides quantitative analysis and research that
9 supports market development and other sector policy initiatives.

10 Budget: \$4,668,610

11 Allocation method: Domestic and export in proportion to energy (TWh)

12 **5.1.4 CONSERVATION AND CORPORATE RELATIONS**

13 ***Vice President Office***

14 The VP's Office provides overall management of the business unit.

15 Budget: \$906,519

16 Allocation method: Sum of allocated costs of the departments

17 ***Conservation Performance***

18 The Conservation Performance group is responsible for verification and validation of
19 energy and demand savings and cost effectiveness analysis of conservation programs
20 delivered to direct or transmission-connected customers and to distribution-connected
21 or LDC customers. The group also manages the review and approval of LDC CDM
22 Plans and the LDC-led business cases for new conservation programs and pilots. The
23 group provides sector-based (residential, commercial /institutional and industrial)
24 engineering support specific to program design, program applications and other
25 technical matters. A key mandate of the group is the assessment of conservation
26 potential through the Achievable Potential Study and other market research studies on
27 customer, channel, partner and brand engagement with conservation programs.

1 Budget: \$3,398,470

2 Allocation method: Domestic class only

3 ***Business Development***

4 The Business Development group is responsible for engaging the marketplace in
5 energy conservation activities and managing relationships with key stakeholders (LDC's
6 and channel partners) and customers to help grow capability across the province. The
7 group provides strategic guidance on key conservation messaging and helps build
8 awareness through its customer outreach activities. Business development is also
9 responsible for delivering conservation solutions to direct connected customers.

10 Budget: \$2,647,841

11 Allocation method: Domestic class only

12 ***Strategic Engagement and Innovation***

13 The Strategic Engagement & Innovation group is responsible for functions crossing the
14 company. The group is responsible for government affairs and issues management,
15 managing relationships with municipal governments, facilitating Local Advisory
16 Committees to support system planning and broader public engagement, and support
17 demand side innovation through the Conservation Fund. The group works closely with
18 the Stakeholder and Public Affairs group to coordinate the IESO's activities.

19 Budget: \$2,125,675

20 Allocation method: Domestic and export in proportion to energy (TWh)

21 ***Program Delivery and Partner Services***

22 The Program Delivery & Partner Services group is responsible for managing the
23 division's budget requirements, qualifying payment requests, developing and managing
24 of contracts, co-ordinate internal audits and compliance tests, all internal and external
25 reporting of achievements and spending of our program and services and managing the
26 delivery of all the conservation programs with our partners.

27 Budget: \$2,180,165

28 Allocation method: Domestic class only

1 ***Stakeholder and Public Affairs***

2 The Stakeholders and Public Affairs group is responsible for media relations, employee
3 communications, editorial services, executive speeches and presentations, French
4 translation, the IESO's corporate websites and social media accounts, conservation
5 marketing and the saveONenergy brand, the Stakeholder Advisory Committee,
6 stakeholder engagement framework, customer education, market training and outreach
7 and support to customers and market participants. These responsibilities stretch across
8 all functions of the IESO.

9 Budget: \$5,341,349

10 Allocation method: Domestic and export in proportion to energy (TWh)

11 ***Marketing***

12 This department has merged with the Stakeholder and Public Affairs department
13 described above. Consequently, it does not appear as a separate category to be
14 allocated in the updated 2016 cost allocation model.

15 **5.1.5 INFORMATION AND TECHNOLOGY SERVICES**

16 ***Vice President Office***

17 The VP's Office provides overall management of the business unit.

18 Budget: \$1,011,151

19 Allocation method: Sum of allocated costs of the departments

20 Information Technology Services supports the IESO's existing business applications
21 and infrastructure, provides internal customer service relating to the IESO's IT systems,
22 and develops solutions to respond to changing business needs. All departments provide
23 broad-based support to all other IESO business units and departments.

24 This business unit includes the following departments:

- 25 • Organizational Governance (\$3,701,929)
- 26 • Business Solutions and Business Analysis (\$12,175,768)

- 1 • Technology Support (\$15,642,927)
- 2 • Solutions (Adelaide) (\$637,841)
- 3 • IT Operations (\$2,266,992)
- 4 • Facilities (\$8,636,858)

5 Allocation method: Total Other OM&A

6 **5.1.6 PLANNING, LAW, AND ABORIGINAL RELATIONS**

7 ***Vice President Office***

8 The VP's Office provides overall management of the business unit.

9 Budget: \$1,168,340

10 Allocation method: Sum of allocated costs of the departments

11 ***General Counsel***

12 The Legal Services group (General Counsel) provides legal advice and guidance on a
13 full range of legal matters including: compliance with all relevant laws and market rules,
14 dispute resolution/litigation support, development & management of contracts,
15 procurement processes for the full range of IESO activities, including conservation
16 programs and generation supply procurements, the development of market rules and
17 programs. It also provides governance and logistical support for the Board of Directors
18 to ensure effective and timely decision-making, and manages requests to the
19 organization under the Freedom of Information and Protection of Privacy Act.

20 Budget: \$4,378,174

21 Allocation method: Domestic and export in proportion to energy (TWh)

22 ***Regulatory Affairs***

23 The Regulatory Affairs group is responsible for monitoring ongoing issues and
24 managing IESO applications to/filings with multiple bodies, including the Ontario Energy
25 Board (OEB), the National Energy Board (NEB), the North American Electric Reliability
26 Corporation (NERC), the U.S. Federal Energy Regulatory Commissions (FERC) and the

1 Northeast Power Coordinating Council (NPCC). Regulatory Affairs manages the IESO's
2 annual revenue requirement submission with the OEB, as well as the IESO's
3 participation in applications before, and any rules, standard, policies, or codes proposed
4 by, the regulatory bodies listed above.

5 Budget: \$2,186,249

6 Allocation method: Domestic and export in proportion to energy (TWh)

7 ***Board***

8 The Legal Services group (Board) provides governance and logistical support for the
9 Board of Directors to ensure effective and timely decision making.

10 Budget: \$715,210

11 Allocation method: Domestic and export in proportion to energy (TWh)

12 ***First Nations and Metis Relations***

13 The First Nations and Métis Relations group (“FNMR”) is responsible for developing and
14 maintaining the IESO's relationship with First Nations and Métis communities across the
15 province. The IESO works to support the participation of Aboriginal communities in
16 renewable energy through targeted incentives and initiatives.

17 The IESO also works to raise awareness and encourage Aboriginal community
18 participation in IESO procurement processes, funding programs, and regional and long-
19 term energy planning initiatives. At times, the First Nations and Métis Relations group is
20 responsible for carrying out the procedural aspects of any duty to consult with Aboriginal
21 communities as identified by the Crown.

22 Budget: \$898,421

23 Allocation method: Domestic class only

24 ***Transmission Integration***

25 The responsibilities of the transmission integration group include regional integrated
26 planning, bulk transmission planning, associated community and stakeholder
27 outreaches and providing support to procurements undertaken by the IESO through

1 performing assessments and testing of connections availability. While the work of
2 transmission integration can benefit all customer groups, especially work on or that
3 directly benefits interconnections, it is primarily performed to benefit Ontario consumers.

4 Budget: \$2,538,417

5 Allocation method: Domestic class only

6 ***Resource Integration***

7 The Resource Integration group is uniquely responsible in Ontario for developing
8 integrated power system plans to meet the projected electricity service requirements for
9 Ontario customers at both the regional and provincial levels. Its plans provide advice to
10 the government to help develop the Long Term Energy Plan and to guide program and
11 capital investment decisions for new initiatives in the market, transmission, conservation
12 and supply resources. The group focuses on the supply aspects of the plan and the
13 integration of market, conservation, supply and transmission considerations to meet
14 Ontario electricity needs. The Power System Planning Division works closely with other
15 areas of the IESO to develop and implement initiatives.

16 Budget: \$2,082,323

17 Allocation method: Domestic class only

18 ***Demand and Conservation Planning***

19 Demand and Conservation Planning (formerly Conservation Integration) develops
20 estimates of electricity demand and conservation resources for the near, mid and long
21 term. Demand and conservation estimates provide context for the development of
22 supply and transmission plans, support regional planning and support the development
23 of demand management programs. Near term forecasts support the development of
24 the 18 Month Outlook.

25 Budget: \$1,271,096

26 Allocation method: Domestic class only

1 **5.1.7 CORPORATE SERVICES**

2 ***Vice President Office***

3 The VP's Office provides overall management of the business unit.

4 Budget: \$412,624

5 Allocation method: Sum of allocated costs of the departments

6 ***Corporate Controller***

7 The Corporate Controller's Department manages and is responsible for asset
8 stewardship, controls and transaction processing at the IESO. This includes ensuring
9 that financial resources are used effectively and that appropriate corporate policies and
10 procedures are deployed in the areas of corporate accounting and reporting, market
11 accounting and reporting, procurement and payroll. The activities carried out by the
12 Corporate Controller's Department relate to ensuring appropriate controls exist and are
13 implemented to validate the IESO's management of public funds. The functional
14 responsibilities for this group are as follows:

- 15 • transaction processing, accounting and financial reporting for both the
16 Corporation and the Market;
- 17 • tax compliance and reporting;
- 18 • monitoring and review of internal controls, as applicable;
- 19 • payroll; and
- 20 • procurement.

21 Budget: \$3,465,121

22 Allocation method: Domestic and export in proportion to energy (TWh)

23 ***Financial Planning and Analysis***

24 The Financial Planning & Analysis (FP&A) group supports decision making and strategy
25 development through leading budgeting and business planning, providing timely and
26 quality analysis, implementing performance metrics and overseeing a risk framework to

1 identify and mitigate risks to the business. FP&A assists other business units to deliver
2 their initiatives by providing value-added analysis and strategic decision support. FP&A
3 also provides financial reporting (i.e., monthly, quarterly and annual) as well as special
4 purpose reports (e.g. Board of Directors, Province of Ontario).

5 Budget: \$1,431,913

6 Allocation method: Total Other OM&A

7 *Treasury and Pension Operations*

8 The Treasury and Pension Operations group manages and is responsible for the IESO's
9 overall treasury related activities (liquidity, debt), the external insurance risk programs,
10 the IESO markets' credit risk framework, and the IESO pension plan's investments.

11 Budget: \$1,704,218

12 Allocation method: Total Other OM&A

13 *Human Resources*

14 The Human Resources group provides leadership, systems, policies and processes to
15 achieve the organizational goals of attracting, developing, engaging and retaining skilled
16 individuals.

17 The Human Resources group provides ongoing and effective support for recruitment
18 and selection, performance management, conflict facilitation, labour relations, resolution
19 of legal and employee relations issues, and employee communications.

20 Working with senior management assists with the implementation of actions to increase
21 individual, group and organizational effectiveness, such as learning and development
22 initiatives, career planning, talent review and succession management planning, and
23 group effectiveness facilitation.

24 Budget: \$3,969,532

25 Allocation method: Total Other OM&A

1 **Settlements**

2 IESO settlements oversees and reconciles more than \$14 billion in funds from the
3 electricity market by collecting funds from buyers; transferring funds to sellers; collecting
4 transmission tariffs; as well as settling the transmission rights market.

5 Budget: \$5,537,837

6 Allocation method: Domestic and export in proportion to energy (TWh)

7 **5.1.8 MARKET ASSESSMENT AND COMPLIANCE DIVISION**

8 The Market Assessment & Compliance Division (MACD) is responsible for investigating
9 and determining whether market participants are compliant with the IESO market rules.
10 MACD oversees activities and conduct in the electricity market through monitoring for
11 anomalous outcomes and the investigation of potential breaches of the rules, which
12 include North American reliability standards. MACD conducts enforcement of the rules
13 in order to foster compliance and deter non-compliance. Market participants who breach
14 the market rules may be subject to sanctions if appropriate. In addition, MACD performs
15 audits and other reviews that can lead to the recovery of payments received by market
16 participants. MACD also works with other IESO business units on market participant
17 communications, education and training to promote compliance. Through its work to
18 improve compliance with the market rules and reliability standards MACD's work
19 benefits all market participants and end use customers.

20 Budget: \$3,662,309

21 Allocation method: Domestic and export in proportion to energy (TWh)

22 **5.1.9 OTHER (AMORTIZATION, INTEREST, UNCLEARED SALARY)**

23 **Amortization**

24 Amortization is the standard expensing of all capital assets. IESO assets and
25 amortization are not tracked by department; hence, they cannot be functionally-
26 classified in detail. Elenchus notes that the pre-merged (December January 1, 2015)

1 asset balances show that 94% of the total assets were former IESO assets. Former
2 IESO assets would be allocated on the basis of TWh.

3 Budget: \$17,500,000

4 Allocation method: Domestic and export in proportion to energy (TWh)¹³

5 ***Interest***

6 The IESO revenue requirement does not include a weighted average cost of capital
7 applied to rate base. Interest included in the IESO's revenue requirement is actual
8 interest on net funding required to finance capital investments and working capital, net
9 of accumulated surplus and other sources of funding.

10 Budget: \$1,017,873

11 Allocation method: Domestic and export in proportion to energy (TWh)¹⁴

12 ***Uncleared Salaries***

13 "Uncleared salary" is an accounting label that is carried over from the legacy IESO
14 financial systems. The amount is made up essentially equally of two items: provision for
15 workforce harmonization post-merger (job mapping and pension-related costs) and
16 amounts related to pension, expensed in the year arising from to IESO's adoption of
17 public sector accounting standards:

18 Budget: \$6,197,679

19 Allocation method: Total Other OM&A

¹³ Elenchus used the 2014 yearend breakdown of former IESO and former OPA assets to derive the weighted average of former IESO assets allocated on TWH and former OPA allocated on Other OM&A. See Appendix B. This calculation indicates that the TWh allocator is a reasonable proxy for this more detailed derivation of an Amortization allocator based on 2014 asset values. As of 2015, the breakdown between former OPA and former IESO assets is not maintained in the accounts.

¹⁴ See footnote 13.

1 **5.2 ALLOCATION**

2 Allocation is the final step in any cost allocation model. It is the step that assigns costs
3 to customer classes on the basis of the cost causality principle. In the case of the IESO,
4 costs (functional-categories) are caused by domestic and/or export customers.

5 Shared expenses relate to functions that are necessary to serve both domestic and
6 export customers, including the operation of the market and overall operation of the
7 IESO. These expenses are essentially fixed and are required regardless of throughput.
8 However, the size of the business units is influenced by the scale of the overall
9 electricity market in Ontario. Further, it is reasonable to view the benefit that is derived
10 by participants in the market as being proportionate to the volume of energy transmitted.
11 For that reason, where a service is used by all customers the cost is normally
12 considered to be energy related and costs are allocated on the basis of TWhs.

13 The IESO does not undertake any activities solely for the benefit of export customers.

14 Some functions exist primarily or exclusively for the benefit of domestic customers. All
15 of the costs of these functions are allocated to domestic customers. As detailed in the
16 preceding section, these include the entire Market and Resource Development business
17 unit, as well as selected departments within the business units of Conservation and
18 Corporate Relations, and Planning, Law, and Aboriginal Relations.

19 Activities dedicated to domestic customers are activities that would not be required if the
20 transmission system were used only to wheel power into, out of, or through the
21 province. Hence, the activities are caused by, or benefit, only the domestic customers.
22 For example, renewable and clean energy procurement is undertaken in accordance
23 with government policy and is therefore considered to be "caused" by in-province (i.e.,
24 domestic) consumers. The primary beneficiaries are Ontario residents. These activities
25 may generate indirect benefits for export customers, but no consideration is given to
26 export customers and their ability to enjoy the benefit of these activities. Put simply,
27 there is no causal relationship between the wheeling of power through Ontario and the
28 cost incurred due to clean energy and renewable procurement.

1 The cost of groups that functionally support the rest of the organization are allocated to
 2 the classes in the same proportion as the costs of the direct market support functions
 3 are allocated (i.e., Other OM&A). This allocation is used for the CEO Office, Information
 4 and Technology Services and three of the five groups within Corporate Services
 5 (Financial Planning & Analysis, Treasury & Pension and Human Resources).

6 The costs related to NERC membership and Reliability Assessments are caused in
 7 large part, but not exclusively to maintain Ontario's export capability. These costs are
 8 allocated on a 50:50 basis to export and domestic customers.

9 Appendix A shows the allocators used for each functional-category. The derivation of
 10 each allocator appearing in the Appendix is described below.

11 **5.2.1 PRIMARY ALLOCATORS**

12 In the IESO cost allocation model, the allocation of energy related costs is based on the
 13 terawatt-hours of energy transmitted. Based on the forecasted 2016 Gross TWh –
 14 inclusive of embedded generation, the Terawatt-Hour Allocator allocates 88.2% of costs
 15 Domestic customers and 11.8% of costs to Export customers.

16 None of the IESO costs are allocated on the basis of demand. Unlike the transmission
 17 system itself, all of the IESO costs are most logically associated with (or caused by) the
 18 energy throughput of customers.

19 The individual customer-related costs (billing of market participants) are not significant.
 20 These costs are not allocated based on the number of customers in each class as they
 21 typically are in distribution cost allocation models.¹⁵

22 Table 3 presents the primary allocators used in the 2016 IESO cost allocation model.

¹⁵ Each market participant receives one bill that includes the fees related to both domestic and export activity. Some generators handle their exports through a separate company that is also a market participant, so each entity would receive a separate bill for the IESO fees.

1

Table 3: Primary Allocators Used in the IESO Cost Allocation Model

	Total	Domestic	Export
Dedicated to Domestic	100.00%	100.00%	0.00%
TWh	100.00%	88.20%	11.80%
Equal Halves	100.00%	50.00%	50.00%

2 **5.2.2 COMPOSITE ALLOCATORS**

3 A composite allocator for each business unit is derived based on the departmental
 4 allocated costs of that business unit. The VP's office for each business unit is then
 5 allocated on the basis of its respective composite allocator.

6 Table 4 presents the composite allocators used in the 2016 IESO cost allocation model.

7

Table 4: Composite Allocators

	Total	Domestic	Export
Market and System Operations	100.00%	88.20%	11.80%
Market and Resource Development	100.00%	97.13%	2.87%
Conservation and Corporate Relations	100.00%	94.39%	5.61%
Information and Technology Services	100.00%	90.33%	9.67%
Planning, Law and Aboriginal Relations	100.00%	93.90%	6.10%
Corporate Services	100.00%	89.14%	10.86%

1 **5.3 COST ALLOCATION RESULTS**

2 The resulting revenue responsibility and revenue to cost ratios are detailed in Table 5.

3 **Table 5: Cost Allocation Results**

	Total	Domestic	Export
Revenue, dollars	\$182,131,970	\$160,644,602	\$21,487,369
Revenue, percent	100.00%	88.20%	11.80%
Revenue Requirement, dollars	\$182,131,970	\$164,124,456	\$18,007,515
Revenue Requirement, percent	100.00%	90.11%	9.89%
MWh	158,942,411	140,190,875	18,751,536
Allocated Cost per MWh	\$1.1459	\$1.1707	\$0.9603
Revenue to Cost Ratio at \$1.1459/MWh	100.00%	97.88%	119.32%

4 Table 5 shows that approximately 90% of the total revenue requirement is allocated to
 5 the domestic throughput. The domestic throughput is close to 88% of the total
 6 throughput. Since the percentage of the revenue requirement (costs) allocated to the
 7 domestic throughput is slightly greater than the percentage of volume attributable to
 8 domestic throughput, when the same fee is assumed for both domestic and export
 9 throughput, the resulting domestic revenue to cost ratio is less than 100% and the
 10 export revenue to cost ratio is greater than 100%.

11 The export variance from 100% is larger than the domestic variance because the export
 12 volume is about one-eighth of the domestic volume. Since the dollar values of the
 13 variances from 100% are identical, the percentage variances differ by a factor of
 14 approximately nine.

1 **6 CONCLUSIONS AND RECOMMENDATIONS**

2 The reasoning that supported the change from net to gross billing for the former IESO
3 usage fee in EB-2013-0381 is equally applicable to the portion of the new IESO revenue
4 requirement that corresponds to costs that were previously included in the OPA revenue
5 requirement. It is therefore recommended that the new IESO usage fee be billed on the
6 basis of AQEW + SQEW + EG as defined in section 3, above.

7 With respect to the justification for differentiating the usage fee that is applied to
8 domestic and export customers, it is noted that the revenue to cost ratios for the
9 separate classes if a single usage fee is adopted would be 97.88% and 119.32% for the
10 domestic and export classes, respectively. If the OEB-approved revenue-to-cost ratio
11 range that is used for most electricity distribution customer classes (i.e., 80% to 120%)
12 is approved for the IESO, the uniform rate would be deemed to be equitable for both the
13 domestic and export classes of customers. Rates within a Board approved range are
14 not considered to be either under-collecting or over-collecting the causal costs related to
15 a customer class, given the degree of uncertainty inherent in cost allocation and other
16 rate making principles.

Description of Allocators

Allocator	Description
Simple Allocators	
DOM	Allocated to Domestic
TWh	Terawatt Hours
HALF	50% Domestic, 50% Export
Composite Allocators	
CCR	Conservation and Corporate Relations
CS	Corporate Services
ITS	Information and Technology Services
MRD	Market and Resource Development
MSO	Market and System Operations
O&M	O&M (i.e., direct department expenses)
PLAR	Planning, Law and Aboriginal Relations

- 1 Note: The allocator values are provided in the Cost Allocation model, worksheet "Allocators". The
- 2 Allocated account balances are provided in the same model, worksheet "Summary by Class & Accounts".

Appendix B: Asset Allocation Test

1
2

Assets

Accounts	2016 Budget	Allocator Used
IESO (Assets)		
Assets	52,281,000	TWh
Market systems & applications	278,458,000	TWh
Infrastructure & other assets	60,180,000	TWh
Assets Under Construction	23,268,000	TWh
Accumulated Amortization	(321,042,000)	Assets
Net Fixed Assets	93,145,000	

Note: The IESO does not have a Rate Base similar to rate regulated utilities. Fixed Assets are allocated to test the assumption that TWh is a sensible allocator for Interest and Amortization.

3 The IESO no longer maintains a split of assets formerly owned by the IESO and
4 formerly owned by the OPA. Therefore, presently the most appropriate allocator to be
5 applied to all assets is TWh.

6 The last year for which assets were divided into former IESO and former OPA pre-
7 integration was 2014. The IESO's 2014 year-end data supported the concept that
8 whether interest expense and amortization expense are allocated on the basis of TWh
9 as proposed or based on the underlying assets makes no difference. The Elenchus
10 evidence dated 15 January 2016 concluded that TWh was a reasonable approximation
11 of an asset-based allocation.

Allocator Comparison

	Domestic	Export
Net Assets Allocated as Above	\$82,156,040	\$10,988,960
Resulting Allocator	88.20%	11.80%
TWh Allocator	88.20%	11.80%
