13299	73]	tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (ie. minor blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety related drive mechanisms to allow use of a travelling robotic assembly. The purpose of this risk is to document the possibly schedule and cost delays associated with unforseen failure of the chopping tool. EDIT 20NOV2015: This risk is also associated with HFD schedule delays due to radiological interferences with RFR.	<u>6756</u>	In Progress	Contingency Plans for HFD and VFD Replacement	This action is associated with Risk ID 14207. 	HFD Installation Challenges due to sagged	There is OPEX which indicates that installation of longer Horizontal detectors, with a dry moderator, may be presented		Active	John Stopar	George Naguib	21-Oct-16	Accept	30-Nov-16	2 1 2	4 2	1	1 2
<u> </u>	guide tube [Window 73]	by major challenges due to sagging of horizontal ICFD guide	Outag	e Window	Window Description								
14205		tubes. A response to this challenge may include delaying longer detector installations until after moderator fill. OPEX		073	073 - HFD Replacements								
		longer detector installations until after moderator fill. OPEX indicates the possibility that guide tube sag is less apparent wi a full moderator. This would have possible impacts to the overall outage schedule if detector installs are pushed out.				There are no Draft, Not Started, In Progress Actions associated	with the risk.						
	Program [Window 28]	There is a risk that, during horizontal in-core flux detector removals, a detector is lodged in the cutting chamber of the Stern ICFD Cutter Tool. Although the tool is built with contingency tooling for a number of "expected" stuck detector positions, contingency planning is required for a variety of other conditions. Due to the already high doses in the SDS2 bunker as well as significat dose rates coming off a stuck detector, contingency planning will need to involve minimizing the amount of time personnel are in the vicinity of the tool, as well as a well docunted process for safe stating the area in the case of stuck detector challenges. 10 Aug 16 (J.Stopar): Less extensive challenges exist for contingency planning associated with the VFDs. A solid plan needs to be formulated for VFDs also.		Active	John Stopar	George Naguib	21-Oct-16	Mitigate	30-Nov-16	2 1 2	4 2	1	1 2

	Design cost increase due to balance of the vendor	Vendor Documentation: All required vendor documentation to progress ECs have been advanced through design completion		Active	Katie Stewart	Doina Idita	26-Jan-17	Monitor	01-Sep-17	2	1 4	8	2 1	4	8
	documentation	(with granted deviations by the DA at the DCAVR). However,	Outage	e Window	Window Description										
		the balance of documents that are expected from the vendor		124	124 - SDC Rm Work										
15127		(i.e. manuals, test reports, etc.) pose a risk on the design. There are several KSB and Velan design documents currently outstanding. Most are at advanced stages of C&D but still carry some residual risk of changing. Due to the issues confronting the anchor DEC, there is a risk that KSB mounting plate may be affected. A design change maybe required if KSB plate has been changed.				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	Possible design cost	There is a risk of design cost increase due to : -The review of		Active	Katie Stewart	Doina Idita	26-Jan-17	Monitor	30-May-17	2	1 3	6	2 1	3	6
	increase due to the pipe whip analysis	the ITF or AVL documents may re-open certain closed items.A majority of the items were reviewed and closed out as part of	Outage	e Window	Window Description					!!-		_ <mark> </mark>	<u> </u>		
	1	submission of R0 of the DEC. However, different reviewers at this time may hold a different viewPipe whip for R-065 to		124	124 - SDC Rm Work										
<u>15134</u>		support floor loading assessment for anchor DEC.Currently the scope for pipe whip analysis to support safety case is unclear. If a non-linear analysis is required, then several hundred hours of effort will be neededFinal nozzle loads will not adversely impact the floor loading assessment or anchor calculations for pump installation (DEC 137042). To meet design completion schedule for DEC 137042 work progressed at risk without finalized piping loads (as the DEC 128660 was being revised). The nozzle loads are nearly final with nearly final vendor information. The revised nozzle loads will be incorporated in the 100% design submission Confirmatory walk-down for DEC 128660 may reveal information that may require further design iteration. With the design being finalized, a confirmatory walk-down is required to ensure there are no further issues in the field. As such, there remains a risk that some information will be revealed triggering changes to the design. The confirmatory walk-down may reveal some interferences with existing design, with a higher risk on support designs. While this may be a cost in the front-end, it will save significant issues during construction. The Aux SDC pumps has utilized 3D laser scans and team members have completed numerous walk-downs to obtain field info				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	ASDC - Design cost increase	There is a risk of ASDC design cost increase due to the following:- stakeholders concern with respect to the impact of		Active	Katie Stewart	Doina Idita	27-Feb-17	Monitor	30-Nov-17	2	1 3	6	2 1	3	6
		heat transfer from the ASDC pump to the concrete from: (a) tack welds on the top-plate; and (b) the pump		e Window	Window Description										
		mounting plate temperature due to the medium. Note: This item		040	040 - Class 2 Electrical Rehab										
		has been included in the ITF and if a qualitative disposition is		104	104 - Vault Projects Before Feede	er Removal									
		not acceptable, then funding will be required to complete a more detailed heat transfer calculation + concrete assessment				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
		There is an unresolved comment on the floor loading													
15202		assessment report from OPG Civil design, which required													
202		additional plate vs. shell sensitivity analysis for the concentrated loads. Additional effort may be required to address this													
		unresolved comment A deviation from L-964 spec is required													
		to proceed with core drilling and potential rebar cutting for the floor slab in R-065. If the deviation memo is not accepted, then													
		a significant re-design maybe required. Required clearance for													
		grouting between the through bolt and the concrete hole walls is too large. There maybe a need to cut two adjacent rebars													
		while drilling holes for the through bolts. additional analysis may													
		be required to nail down the acceptance criteria for rebars cutting.

	Interferences with JV Work [Window 8]	BoP project work will get delayed due to JV work being on critical path, this will lead to a contractor stand down resulting in additional costs and schedule delays. This will affect the vault work for the containment projects, e.g. Installation of the manifolds, roll-up doors at the airlocks and transfer chamber doors. Per FOAK feedback, actions associated with this risk will be allocated against the applicable BoP projects that are at risk such as NPC, EHS, ASDC & the cross cutting area of radiography/PAUT.				Currently identified ~82 piping welds inside the vault (excluding feeders). the balance of plant and P&M scope is listed below. The action is to develop a path forward for an alternative to conventional radiography and implement these alternatives. Note: Action due date is tied to completion of first occurrence of alternate RT methods.				March 1, 2017 Small Controlled Area Radiography and Pulsed X-Ray are currently available options and alternatives to conventional radiography. Actions are in place to enable projects. Safety, Quality, Schedule, etc. are being addressed and reported on regularly at the project issues meeting. Funding has been made available to have IMS support the initiative and provide QA oversight, RP planning, etc. Refer to issue 294 for regular updates. first occurrence of SCAR is expected in May 2017 pending any project schedule changes. ***OLD Status Updates prior to Feb 2017*****

	73628 Emergency Lighting-Risk of New EP	Event: Electrical cable may not fit in the existing EP's, requiring additional tooling and labour for EP drilling to create a new EP	3	Active	Marcus Sztrimbely	Breanne Stramenga	01-Mar-17	Monitor	12-Jun-17	3	1 3	9 (3 1	3	9
	Creation	for the cable. Cause: The size of Teck cable that is be run	Outag	e Window	Window Description										
		through EP 41218 and the amount of space left in the EP to fit another cable Impact: Additional costs for tooling/labour,		000	000 - No Window Related										
<u>15181</u>		Schedule delays to obtain appropriate approvals and execute work Background: Teck cable is to be run through EP 41218, however, the penetration is fairly full and may not be able to accommodate the size of the cable. ITF Item 43 was created to poke a hole through the EP to determine whether the cable can fit. There is risk that the cable may not fit through the EP or that other cables may be hit when removing the sealant to accommodate the new cable. EP 41217 may also be used but it is also fairly full. If the cable can not fit in the existing EP, there is a risk that drilling will need to occur through the concrete wall to create a new EP for the cable. If drilling through the concrete wall is to occur, this can impose a cost and schedule impact to the project and will also trigger the update of multiple engineering drawings to document station configuration.				There are no Draft, Not Started, In Progress Actions associated	with the risk.

		Event: Higher loads (from original analysis) have created a fatigue usage on the vessel not previously registered by OPG.	2	Active	Chad Da Maren	Andre Sidiropoulos	23-Feb-17	Mitigate	31-May-17	4 2 1 8 3	3 1 1 3
	to Increased Feeder/FC	The original analysis documented that the Calandria Shield Tank	Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments	
15		Assembly (CSTA) was exempted from detailed fatigue analysis based on the methods of NC-3219.2 per ASME Sec. III 1977, including summer 1977 addendum. OPG would require the ANSYS model to either: demonstrate in greater detail that the CSTA remains exempt from detailed fatigue analysis, or address reactor transients throughout the extended life of the CSTA. Cause: The stress analysis performed during refurbishment has shown increased loads throughout the Feeder and Fuel Channel Assemblies. These higher loads are being transferred into the CSTA. The increased mechanical load stresses have been shown to meet code allowable stresses and at current, would enable design registration of the CSTA with the TSSA in support of refurbishment. Impact: If the design is not registered with the	9983	Draft	Obtain Executive Concurence to Register Calandria Vessel Registration Update As-Is	Higher stresses on the End Shields have created a fatigue usage on the vessel not previously registered by OPG. The original analysis documented that the vessel assembly was exempted from detailed fatigue analysis based on the methods of NC-3219.2 per ASME Sec. III 1977, including summer 1977 addendum. If the design is registered with the TSSA as-is (showing fatigue usage), OPG program owner's for LCMP & PIP will need to rereview the design package and determine impacts on their programs. OPG Sr. Management concurrence is sought prior to proceeding with registration.	Chad Da Maren	Andre Sidiropoulos	17-Feb-17		
<u>15116</u>		TSSA as-is (showing fatigue usage), the RFR project may continue to fabricate, ship and install calandria tubes (CT) as a CRN has been obtained from the TSSA for the updated CT drawing and TS. However, a finalized design report must be submitted to the TSSA prior to re-start of the unit. Prior to re-	<u>9984</u>	Draft	Obtain Stress Analysis model/inputs for Calandria Vessel Analysis	OPG has the rights to the model/inputs based on commercial agreement in place with Joint Venture for specific scope of work. If OPG has rights to the model/inputs, request them from Joint Venture.	Chad Da Maren	Andre Sidiropoulos	17-Feb-17		
		start is conservative as the existing submitted report is still a valid design basis for the retubed configuration but a point in	Outag	e Window	Window Description						
		time post-re-start exists when FCs have crept axially to a		080	080 - Fill Calandria						
		particular length that the current report is not a sufficient basis and requires updated to account for the higher loads at that time. Final CRNs have been obtained for all portions of the Feeder Piping assembly. Therefore, this issue has no impact on manufacturing or installation of feeder related items. A final CRN has been obtained for the Calandria Tube material TS update. Therefore, this issue has no impact on manufacturing or installation of calandria tubes. However, this final CRN must now be revised/updated

14850	Annulus Spacer Retrieval resulting in Contamination of Retube Platform	[Execution Phase] Event: An inordinate amount of time to be spent in decontaminating the Retube Tooling platform prior to re-commencement of the EF flask series. In addition, PCD-14 requires that original activated shield plugs be swapped for new shield plugs in parallel with establishment of the vault crane maintenance window 015. Cause: If the PHT Vacuum dry process elevates the loose contamination levels of internal PHT components that will be handled during this portion of the annulus spacer retrieval. In addition, the annulus spacer retrieval tool has been based upon the current design of the tool used during regular SFCR campaigns – the last (and only) annulus spacer retrieval tool was modified based upon CIGAR data that was obtained just previous to the execution of reactor face work. New CIGAR data will NOT be available for the 6 channels that are going to be the subject of the annulus spacer retrieval during Unit 2 Refurb – all available OPEX has been applied to the design of the ASRT cartridges being used for Refurb BUT there still exists the risk that extrapolated data by which the design has been based upon, may be in error leading to ASRT cartridge failure in channel. Impact: Delays on the critical path schedule which can be mitigated by progressive decontamination steps an increased radiation protection surveillance during annulus spacer execution. If OPG F/H cannot complete the swap for new shield plugs in parallel, then there could be a push to the Refurb critical path duration in the order of 6 to 12 hours. 	roduction items/materials crapped due to failure of	Event: There is a risk that production item(s) and/or material (s) may be scrapped if a supplier fails to pass pre-production	1	Active	Chad Da Maren		23-Feb-17	Monitor	01-May-19	1	1 5	5	1 1	5	5
Pr	re-Production	qualification (PPQ). Cause: In limited cases, suppliers have	Outag	je Window	Window Description										
Q	ualification	been granted approval to begin production manufacturing prior to the close-out of PPO. This approval has been granted by the		000	000 - No Window Related										
<u>15193</u>		JV following OPG's Acceptance of a Design Deviation Requests (DDRs) from the applicable requirement within OSM technical specification(s). The basis of these case-by-case Acceptances has been that production may commence as long as production manufacturing does not proceed past an accepted/approved PPQ step. The intention of permitting the start of production is to mitigate the higher risk of suppliers failing to deliver production items/materials in time to support the RFR execution schedule. This risk is intended to document the residual risk of allowing production to commence prior to PPQ close-out. Impact: In the event that a supplier fails PPQ but has already commenced production under an Accepted DDR, the supplier remains accountable contractually for the cost implications of scrapped production item(s)/material(s). The schedule risk tied to suppliers failing PPQ, regardless of whether or not production has commenced, is generically assessed below. 	Spread of Contamination during RFR Waste	Execution Phase Risk: EVENT: There is a residual risks that that there will be spread of loose contamination in the RFR WTS	3	Active	Michael Hersch	Sean Carpenay	27-Feb-17	Monitor	15-Nov-17	2	1 2	4	2 1	2	4
	Processing of crushed PT	and RWPB, with negative impacts on the schedule and worker	Outag	e Window	Window Description										
	(possible similar risks to EF/CT/CTI)	dose due to need to cleanup. This residual risks remains despite best practices in RFR WTS design and procedures. CAUSE: This		114	114 - End Fitting Removal										
14319		risk is postulated to occur by loose contamination being spread from the PT chute that links the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is retracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring. By design, it is expected that the 'dirty' pins on the WTS lidding station will become contaminated over time as they lift the debris cover. there are separate 'clean' pins for lidding the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of this loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern. IMPACT: Based on OPEX with a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose contamination led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.				There are no Draft, Not Started, In Progress Actions associated	with the risk.

13266	non-standard waste streams	[Execution Phase] Event:: Gap in JV Planning for managing non standard ILW waste streams (VRS press, chute, and VRS/VFF filters) and miscellaneous ILW. Cause: There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest. Impact: Cost Impact Schedule Impact	5929	In Progress	The plan for the VRS press and chute	The plan for the press and chute is: 1: Decontaminate in the WTS using CO2 blasting 2: Debris from CO2 blasting will go into a RWC/DSO assembly 3: Following decontamination, the press will be removed and placed in a "strong box". This "strong box" will either be stored on-site or off-site for approximately 10-15 years (after storage period, the press will be size reduced), or will be shipped to a decontamination facility for further decontamination and size reduction. For this plan to be viable, the following concerns will need to be addressed: 1: Impact of decontamination debris in the RWC/DSO assembly (long term storage) 2: Potential and impact of condensation build up during decontamination. There should be no water in the retube waste container. 3: Need specification of the proposed "strong box". At a minimum, this will still need to meet Minstry of Transportation requirements (tie-downs) for on-site transfer. 4: To confirm that the EA and licence of the RWSB can accept the new waste stream. 	Waste - ILW containers for non-standard waste streams	[Execution Phase] Event:: Gap in JV Planning for managing non standard ILW waste streams (VRS press, chute, and VRS/VFF filters) and miscellaneous ILW. Cause: There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest. Impact: Cost Impact Schedule Impact	5930	In Progress	The plan for primary HEPA filters and Misc ILW	The plan for the primary HEPA filters and misc ILW is to place the waste items in the RWC/DSO assembly. For this to work, an interface for the RWC/DSO assembly to allow the waste to be safely placed in the waste container will need to be designed. The concerns associated with this plan are: 1: Safety assessment may need to be revised to assess the impact of the proposed waste streams 2: Long term safety: filters will contain fine zirconium dust, so there is a higher chance for a fire to occur in the RWC/DSO assembly during storage. 3: Need to confirm if the waste should go into the RWC/DSO assembly or the Darlington in-station flask. 13266	non-standard waste streams	[Execution Phase] Event:: Gap in JV Planning for managing non standard ILW waste streams (VRS press, chute, and VRS/VFF filters) and miscellaneous ILW. Cause: There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest. Impact: Cost Impact Schedule Impact	9075	In Progress	Determine on-site storage placement and logistics movements of Feeder Shielded Overpack Containers	During the Feeder removal campaign (July/Aug 2017), there is a potential for Feeders to contain higher radiation levels which would require a shielded overpack. These shielded overpacks are large in size and may not be required for each of the 220 LLW containers that will be generated during the 19 day removal window. Both RFR and the OPG RMT group will need to determine on-site or just-in-time logistics storage and movement of these overpacks from site (within the PA) or offsite. Some notables: 1. Placement on site 2. Placement offsite 3. Storage in Weather Enclosure while truck being loaded (craning activities, truck with its own crane, distance between Weather Enclosure walls, forklift movements, etc.)		Yung Cheung	31-Mar-17	02FEB201' notified an containers Loading of the weather a trailer. 13266	non-standard waste streams	[Execution Phase] Event:: Gap in JV Planning for managing non standard ILW waste streams (VRS press, chute, and VRS/VFF filters) and miscellaneous ILW. Cause: There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest. Impact: Cost Impact Schedule Impact	<u>10156</u>	In Progress	Develop a Contingency Plan for Misc ILW Generated in 2nd half of 2017	For 2017 RFR projects decided that misc. ILW can go into lead-lined drums, as the expectation was that only a small volume of misc ILW was expected to generated. RFR projects spoke with WWMF to confirm if there was adequate storage space in the trench at WWMF for the drums. WWMF verbally confirmed that there was sufficient room for 12 drums (2 shipments). RFR confirmed that only 2 drum shipments in 2017 would be required. On Feb 7, 2017, WWMF communicated to refurbishment waste SPOC and RFR that they can store 6 drums and will confirm if they can accept the additional 6 drums by July 2017. RFR began to work on a contingency to the lead-lined drums. This contingency will likely be implemented in the 2nd half of 2017. A potential contingency to the drums is using Darlington in-station flasks. In order to implement the contingency: 1. Determine who will be procuring the drip can liners and dividers that will go into the in-station flasks. It is estimated that 6 drip can liners will be required (CATID 216484). 2. Initiate work request for mechanical maintenance to place the drip can liners into the Darlington in-station flasks. 3. To develop a plan to control/prevent contamination of the flasks. RFR projects needs to contact RP. 4. Secure SATM for storage of filled in-station flasks, if required (backup to flask storage at el 92.5).	Jeffrey Palmateer	Yung Cheung	01-Jul-17

		Description The Clean Room (which will be located at the DEC)	2	Active	Jeffrey Palmateer	Kevin Hill	16-Feb-17	Monitor	31-Oct-16	4	4 3	16	2 2	2 2	4
	Delays	is required to be in service to support Calandria Tube Installation, and Fuel Channel Installation activities. Currently	Outag	e Window	Window Description										
		(as of 16Feb2017), the design completion date is scheduled for 17March2017 and the construction schedule has yet to be		071	071 - Trial CT Install										
		provided to OPG. Cause Procurement activities on the Clean		118	118 - CT Install Series										
		Room have been delayed due to focus on the other Procurement Packages that were originally required to be		185	185 - RFR-Clean Room CT and	FC Preps									
14684		delivered as part of the Definition Phase Complete Milestone. Currently, the Clean Room is scheduled to be delivered, and setup at the DEC by 23JAN2017, however, until the design is completed, the Lead Time associated with manufacturing and delivery is an estimate only, and manufacturing start will not occur until the design is finalized. Currently, there is significant float available in the schedule, as the Clean Room is not required to be in service until late 2017, however, consequences in delays to construction beyond this need date would be very significant. Impact Currently, there is significant float available in the schedule, as the Clean Room is not required to be in service until late 2017, however, consequences of delays to construction beyond this need date would be very significant as CT Preparation (to support CT Installation) and Subassembly Preparation/EF Preparation (to support FC Installation) could not be completed. Day-over-day Critical Path delays would be experienced until the Clean Room could be placed into service.				There are no Draft, Not Started, In Progress Actions asso	ciated with the risk.								
	Shortage of Mock-up Components to Support	Description In order to support the needs of the Execution Phase of the project, the JV will be required to train a large	3	Active	Jeffrey Palmateer	Kevin Hill	03-Mar-17	Mitigate	01-Dec-18	2	2 1	4	2	1 1	2
		number of staff on RFR activities. All of these training programs	Outag		Window Description										
		will require some mock-up components, such as Welded Bellows Flange Coupons to support Bellows Cut Training for example.		071	071 - Trial CT Install										
		The requirement for mock-up components is expected to be			076 - Upper Feeder Installation										
		particularly intensive for the CT Install Series, where Operator Qualification requires fabrication of multiple consecutive			082 - RTP Removals, Bridge Re										
		replacement CT rolled joints that meet leak tightness and geometric criteria. It should be noted that fluctuations in the			083 - Lower Feeder Installation										
		Project Execution Schedule can also impact mock-up component		098	098 - CTI Release										
		need dates as Training start dates will have to be tied to the		101	101 - Remove FM Bridge and Ir	nstall RTPs									
		start date for Execution of the work in the field plus appropriate float. Cause In order to complete the Job Performance		112	112 - PT Sever										
		Measure (JPM) portion of the RFR Training Programs, it is		113	113 - Sever Bellows										
14681		expected that Trainees will be required to operate the RFR Tooling, and complete a varying number of cycles of RFR Series			114 - End Fitting Removal										
81		Work Programs on the mock-up. This will require varying		115	115 - Pressure Tube Removal										
		quantities of mock-up components to support this work. For CT Install activities, mock-up component demands are expected to		116	116 - CTI Removal										
		be particularly high due to the requirement for each Operator to		117	117 - CT Removal										
		fabricate multiple replacement CT rolled joints meeting leak tightness criteria. Providing a once rolled, released and		118	118 - CT Install Series										
		conditioned CTSB to facilitate completion of 1 replacement		119	119 - Fuel Channel Install Serie	S									
		rolled joint will require a CTSB, a CTI, and a CT Spool Piece to fabricate the "original construction" CT rolled joint. Another CTI		920	920 - RFR Series Training										
		and CT Spool Piece will be required for the replacement rolled joint. If any of the replacement rolled joints fail to meet either the geometric or leak test requirements, operator qualification would require repeating the qualification program, driving the requirement for even more mock-up components. Impact Unavailability of mock-up components to support training would result in an increase in Proj				There are no Draft, Not Started, In Progress Actions associated	ciated with the risk.

14682	3 Areas (RWPB, and	Description During Execution Phase, there is a high probability that some of the Tooling used for RFR Activities will become contaminated through use. In the event that an issue with a tool is experienced, the tool is contaminated (and cannot be easily decontaminated/has fixed contamination on it), and troubleshooting of the tool is decided to be done off the face, mock-ups will be required in a Zone 3 Contaminated Tooling Workshop (i.e. the RWPB). Additionally, even if a Tool functions as planned during use on Unit 2, it is stated in 509407-0002-00000-30IM-0025 that Tooling will be taken to a Tooling Contaminated Storage Facility, with Level 1 Commissioning prior to use on a subsequent Unit being completed in the RWPB rather than at the DEC. Mock-ups will be required in the RWPB to support complete this Commissioning. It needs to be ensured that an adequate quantity of mock-ups, and space to set-up these mock-ups are provided in the RWPB, and in the Tooling Maintenance Facility. Cause Contaminated Tooling that requires work may be very challenging to release outside the Protected Area to an offsite facility (Tooling Maintenance Facility) to allow appropriate troubleshooting, repairs and testing to be completed. UTPs may require significant remedial actions to be completed to remove contamination before release. These actions may be impractical from a schedule perspective, or may not be successful. Return to Service of Tooling following completion of Testing and Level 1 Commissioning before the Tool is declared "Ready for Service". Additionally, in order to complete Level 1 Commissioning and "Ready for Service" tagging on Tooling being brought back to site for use on Subsequent Units, mock-ups in the RWPB will be required. Impact Generally, in the event of an issue with a Tool during Execution that requires troubleshooting and repairs to be completed off the Reactor Face, spare Tools will be available to	3	Active	Jeffrey Palmateer	Kevin Hill	03-Mar-17	Mitigate	01-Sep-17	2	2 2	4	2	1	1 2

	~25 Years- OPG Obligations	since new construction (~25 years). The Risk Event is that OPG does not meet its obligation to provide the level of support required to meet the Project Schedule for the New Fuel Load Series, or the proposed New Fuel Loading Sequence is rejected by a Regulatory Authority and the Series Duration is extended. Cause: Extensive interfacing is required with OPG- Fuel Handling and OPG- Security to issue a large volume of New Fuel to the JV in a timely manner to support the production rates required to meet schedule targets. This volume of fuel transfer is significantly larger than that seen during normal operations. In addition, the New Fuel Loading Sequence being followed for Refurbishment will vary from that followed for New Construction (loading of NFBs into a Fuel Channel without immediately installing the Inlet SP and CP) and there is a risk of Regulatory Authority rejection of this sequence. Use of this sequence is a key assumption in the Basis of Estimate for this Series. Impact: Inadequate planning and understanding of Interfaces and Division of Responsibilities between the JV and OPG or rejection of the proposed New Fuel Loading Sequence by a Regulatory	<u>9449</u>	In Progress	FFRB - New Fuel Loading Training Plan to be submitted by JV Training Department to Nuclear Refubishment	New Fuel Loading Training Plan to be submitted by JV Training Department to Nuclear Refurbishment Training Department (Silviu Idita) for review. 	RWPB - Increased Risk of Surface/Airborne	EVENT: There is an increased probability/risk of surface/airborne radioactive contamination spread inside/outside	3	Active	Johnathon Hash	Scott Stafford	22-Feb-17	Mitigate	01-Aug-17	5 3	3 4	20	1 1	1	1
14464	Contamination Spread inside/outside RWPB	of the RWPB during RWC/DSO filling/lidding activities. CAUSE: The critical activities associated with the high risk is RWC/DSO travels between the lidding station and the hardware station. There is a high potential for presence of loose surface contamination on the RWC/DSO containers from the filling activities (PT, IEF, CTI, AS) and the lidding activities (debris cover removal/installation, RWC and DSO lids removal/installation). The RWC/DSO is expected to exit from the lidding station to the hardware station several times during the process. IMPACT: During these times, surface contamination on the RWC/DSO can become loose and spread across un-controlled areas/barriers causing loss of contamination control in the vicinity, in the building and potentially outside of the building in the unzoned area, and ultimately to the public domain. Without a barrier/structure/enclosure installed within the lidding station and the hardware station corridor to assist with control of contamination, there will be a high potential for work stoppage associated with the WTS activities leading to a backlog of reactor components to be processed. Ultimately, leading to a major impact to RFR critical path work while a makeshift structure/enclosure is designed and installed, or major cleanup of the area inside and potentially outside the RWPB. It is estimated that it might take up to 2 weeks to either design/install a controlled structure/barrier, and to perform decon activities. There is also the risk that the Regulator may demand additional barriers to prevent recurrence and additional analyses to ensure public safety. RWPB - Increased Risk of
Surface/Airborne Contamination Spread
Contamination Spread
incida/outsida DM/DR

EVENT: There is an increased probability/risk of surface/airborne radioactive contamination spread inside/outside of the RWPB during RWC/DSO filling/lidding activities. CAUSE: The critical activities associated with the high risk is RWC/DSO travels between the lidding station and the hardware station. There is a high potential for presence of loose surface contamination on the RWC/DSO containers from the filling activities (PT, IEF, CTI, AS) and the lidding activities (debris cover removal/installation, RWC and DSO lids removal/installation). The RWC/DSO is expected to exit from the lidding station to the hardware station several times during the process. IMPACT: During these times, surface contamination on the RWC/DSO can become loose and spread across un-controlled areas/barriers causing loss of contamination control in the vicinity, in the building and potentially outside of the building in the unzoned area, and ultimately to the public domain. Without a barrier/structure/enclosure installed within the lidding station and the hardware station corridor to assist with control of contamination, there will be a high potential for work stoppage associated with the WTS activities leading to a backlog of reactor components to be processed. Ultimately, leading to a major impact to RFR critical path work while a makeshift structure/enclosure is designed and installed, or major cleanup of the area inside and potentially outside the RWPB. It is estimated that it might take up to 2 weeks to either design/install a controlled structure/barrier, and to perform decon activities. There is also the risk that the Regulator may demand additional barriers to prevent recurrence and additional analyses to ensure public safety.

NR-Radiation Protection to monitor JV progress on 8429 In Progress implementation of an enclosure between lidding and hardware stations in RWPB.

A memo was submitted to the JV from OPG RFR requesting the JV to implement an enclosure between the lidding and hardware stations of the RWPB to ensure proper contamination controls. See Action #8428 for more details and a copy of the memo. As an oversight activity, NR-RP will MONITOR work on the enclosure to ensure that it is progressing according to JV schedule. NR-RP will work closely with OPG RFR to ensure that the work does not get stalled or derailed. This action will be closed once assurance has been granted that the enclosures will be installed on both assembly lines of the waste tooling system 25AUG2016 - JC - Liette Lemieux, Johnathon Hash and Jeff Johansson are at a walk down/ site tour of ATS. This topic is to be discussed.

Johnathon Hash

Joe Cicchini

30-Jun-17

Trolley access door at the Lidding Station creates a potential of contamination spread when opened.

(10 Aug; JJ). This is a brief summary of

the latest oversight activities on the subject

RFR had communicated to the JV that an enclosure is needed to minimize the potential of contamination spread and help facilitate WTS execution, see attached correspondence.

The enclosure would extend from the east end of the Lidding Station covering the whole of the Hardware Station, see attached WTS layout.

Two independent enclosures would be erected to avoid cross contamination between the two lines.

RFR considered the original RPS PermaCon design (see attachment #1 e-mail below) too expensive.

RFR would like to explore if the Project can benefit from the tenting experience of the IMS group at Pickering for the proposed enclosure design and had communicated to the JV to start the enclosure design based on a scaffolding concept.

RFR had communicated to the JV high level expectations of the enclosure including the need to provide breath air headers at the Hardware Station, see attached e-mail.

Currently the JV is in the process of developing a conceptual design; OPG will have the opportunity to review and accept. (Sept 13/2016; JJ) A meeting was held at the ATS facility in Cambridge on Thursday, Aug 25 to review JV RP enclosure concept and confirm elimination of the need for loose contamination survey and decontamination on each exit of DSO from lidding station. The meeting was attended by the JV design team and OPG RFR & RP Teams. Attached below (attachment #2) is the minutes of meeting from the meeting. A working group committee to be established and meet to discuss the requirements for the enclosure and its operational use. An update will be included herein upon issuance of minutes of meeting from the first committee meeting. 15OCT2016 JC - Discussion are in progress as to whether or not a full enclosure, including a roof, will

						There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	Refurbishment Breathing Air Support for Bulkhead	EVENT: SDLU project group is preparing EC 136384 as a contingency to allow Refurbishment Breathing Air to be used to	3	Active	Andy Ireland	Kris Dabiran	15-Jan-17	Accept	29-Jan-17	3 3	3 3	9	3 :	3 3	9
	Installation	install the U2 containment bulkhead. The current refurbishment	Outage	e Window	Window Description										
		plan is to use Station Breathing Air for the installation of the Bulkhead. In the case that station breathing air is not available		505	505 - Breathing Air - Install and T										
<u>15043</u>		(i.e. D1711 outage moves, or unplanned long forced outage) the contingency plan is to have EC 136384 available to allow refurbishment to become independent from the station needs for bulkhead installation. Use of EC 136384 relies on the Refurbishment Breathing Air System being installed on time. Note that as the defueling campaign moves ahead, there is less of an overlap between the bulkhead installation and D1711. CAUSE: Shutdown Layup has a planned schedule with the Vendor and pulling tasks ahead may not be feasible. In addition, there are delays day-by-day in the field on the breathing air project. There is no room for schedule float as the AFS date is currently February 17, 2017 to support bulkhead installation. IMPACT: Delay to critical path of Refurbishment. Increased costs for more labour work etc.				There are no Draft, Not Started, In Progress Actions associated	with the fisk.								
	Storage of Component Internals [Window 2, 3,	EVENT: Procurement of new parts for replacement is needed. In addition, there is no plan in place to store valve internals which	4	Active	Andy Ireland	Jos Diening	15-Jan-17	Monitor	31-Jan-17	2 2	2 4	8	2 2	2 4	8
l _E	48]	can lead significant quality degradation of the valve internals. CAUSE: 1) Poor/inadequate storage. 2) Poor/Inadequate Layup		e Window 002	Window Description 002 - Conventional Side Layup										
13536		of parts taken out. 3) Obsolescence of components IMPACT: The delay of finding replacement parts (via ordering of new		048	048 - HTS Aux Drain, Purge, Outsid	de Vault									
		parts, NICR, etc) may cause additional costs (e.g. replacing degraded components) and schedule delays to refurbishment restart.		0.0	jo io mio nai Diami, a goroatos	There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	SDLU Pre-requisite	EVENT: Prerequisite work required before breaker open may be		Active	Andy Ireland		15-Jan-17	Mitigate	01-Feb-17	2 4	4 4	8	1 4	1 1	4
	[No Window Related]	delayed. CAUSE: 1) Poor quality vendor installation planning due to excusable delays.(Some project designs are currently	Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comme	ents				
<u>13619</u>		delayed and challenging N-PROC-MA-0022 milestones. These delays are partially caused by OPG inefficiencies in reviews and late scope identification). 2) Productivity lower than planned due to OPG coordination and planning (e.g. permitry, work authorization, RP support). IMPACT: Increased labour costs and additional trades standby costs.	<u>5510</u>	In Progress	Initiate Readiness Stakeholder meeting for Breathing Air	Stakeholder meeting to be set at T-5 to ensure Vendor has everything to start execution. 	TG- Inadequate/unavailable	EVENT: The Turbine Generator work requires specialty tooling.	2	Active	Peter Moore	Arber Puci	24-Feb-17	Mitigate	01-Jun-18	2	1 3	6	1	1 2	2
- I - I-	Tooling [All units]	As part of the contract between JV and OPG, OPG will provide all the tooling but JV will be maintaining them for the duration	Outage	e Window	Window Description							<u>, , , , , , , , , , , , , , , , , , , </u>		•	
14588		of the work. CAUSE: Tooling unavailability has the potential to affect work, the specialty tooling has to be manufactured if its	(061	061 - Turbine Generator Major O	verhaul									
8		broken or lost. There is also a potential of a station outage to		100	100 - TG and Condenser Work Ph	nase I									
		occur at the same time therefore limiting the availability of the tools. Impact: Tooling unavailability can impact schedule.				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	TG - Potential Impact due to application and	EVENT: The operation support for the TG project is schedule is on a 5 days x 10 hours Monday to Friday schedule, and, if		Active	Peter Moore		24-Feb-17	Accept	25-Dec-17	3	1 2	6	3	1 2	6
	modification of Work	needed can accommodate some changes to / and or delays to	Outage	e Window	Window Description										
	Protection/Permits	the implementation of the work protection requirements (operational permits) during the week end or the back shift.		061	061 - Turbine Generator Major O	verhaul									
14952		OPEX shows that initial application of Permits and inevitable		100	100 - TG and Condenser Work Ph	nase I									
52		required modifications to the permits will delay the Project Progress CAUSE: In case there is no support available for the week end or the back shift some required permit evolution will not occur therefore impacting and delaying the work downstream. IMPACT: This has the potential to impact the schedule				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	TG - ESES Vendor Technical Field Advisor	EVENT: TG project is hiring Technical Field Advisors from the vendor to provide guidance and support execution. The ESES	1	Active	Todd Josifovski	Arber Puci	24-Feb-17	Monitor	28-Mar-18	2	2 1	4	2	2 1	4
	(TFA) Greater Support	Vendor (Alstom/GE) provided an estimate of the expected cost	Outage	e Window	Window Description										
13	than Anticipated [All units]	based on the TG project schedule. CAUSE: The ESES Vendor (Alstom/GE) Technical Field Advisor costs can be greater than	(061	061 - Turbine Generator Major O	verhaul									
13552		anticipated in the estimate provided. This could be due to		100	100 - TG and Condenser Work Ph	nase I									
		additional technical field support required to shore up EPC vendor capability/expertise, additional support to support the schedule, or due to major discovery work extending the overall turbine window. IMPACT: This can lead to extra cost.				There are no Draft, Not Started, In Progress Actions associated	with the risk.								
	TG - Risk of Additional	EVENT: Extended maintenace will be performed on U2 during	1	Active	Todd Josifovski	Arber Puci	24-Feb-17	Accept	31-Dec-17	2	2 1	4	2	2 1	4
	Spare Parts Costs as a Result of Maintenance	refurb outage. The lesson learned and the findings will be used to plan subsequent units 1,3,4. Cause: For subsequent units	Outage	e Window	Window Description										
	OPEX [All Units]	1,3,4, additional turbine generator spare parts would need to be		061	061 - Turbine Generator Major O	verhaul									
<mark>&</mark>		procured from OEM or OPG Warehouse, will be required as a result of maintenance OPEX gained on the first unit. IMPACT:		100	100 - TG and Condenser Work Ph	nase I									
		this can result in additional cost impact. No schedule impact.													
	HFE integrated validation post-DCAVR	EVENT: Based on previous OPEX, performing integrated validations on large, complex systems should be performed in a	1	Active	Peter Moore	Rajeev Leekha	28-Feb-17	Monitor	31-May-19	1	2 4	4	1	2 4	4
		timely manner to avoid expensive engineering re-work or critical	Outage	e Window	Window Description										
		path delays to Refurbishment. CAUSE: Any discovery issues that affect the designs associated with the Turbine Generator		000	000 - No Window Related										
14905		control systems and the supporting/interfacing systems will likely be complex and require substantial time to rectify. Performance of the HFE integrated validation post-DCAVR and towards breaker open for Unit 3 increases this risk to the project. IMPACT: Part of the risk is the time necessary to design and implement any computer-based changes, as the lead time for such changes are generally long. The worst-case scenario is computer interface design changes that impact the critical path for the TG control system and HMI that threatens the Unit 3 refurbishment timeline.				There are no Draft, Not Started, In Progress Actions associated	with the risk.

797	Vendor technical proficiency and less than adequate adherence to design governance may lead to unforeseen issues during design implementation/execution, leading to rework, cost overruns and schedule delays.	Event: Failure to follow processes as written in design governance and failure to rigorously complete all required steps may not allow the full benefit of the robustness of the ECC design process to be realized. Cause: The many steps in the process are typically built upon previously identified process short-comings, and failure to rigorously execute each step may lead to re-work, for example failure to rigorously complete system heath/component health report research, failure to complete an effective COMs meeting, failure to complete a meaningful OPEX search, and failure to identify and address issues in the Issue Tracking file (ITF) may lead to an inadequate design. Impact: The inadequate design may not be fully released until the point of installation/execution, at which time rework, cost overruns or schedule delays may occur.	9785	In Progress	Oversight of software qualifications and documentations	Implement Oversight of vendor compliance to software qualifications and documentations.	Rajeev Leekha	Bhaskar Pillarisetty	30-Jun-17	 Majority of refurbishment designs are mature and have had the benefit of OPG oversight and questioning attitude wrt to SQA. This approach has discovered SQA issues such as in AHS and the Fire system. Risks of additional findings are low. Software audits have occurred on select projects to review software governance adherence. CCD spoc has been involved in most of the large projects involving software, eg EPG3, T/G, SDC, PSVS, RFR, HWMB, which are following proper SQA processes. ECC Design scoping checklist has been improved in section 2.7 – Software.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.								(7 June Johansson): Initiate a search of the smears that were taken during 2015 VBO on Unit 2 and, if found, perform count on the smears and document results. (18 July; JJ) A search for the smears that were apparently taken on Unit 2 during the 2015 VBO was unsuccessful. Decision to initiate a new set of smears on Unit 4 during D1641 was made and smears were taken. Some of the areas/systems include in this smear program are (see attachment #1 below for more details):
										Floor under pressurizer x2
										Floor near ball screw pit. 1 x east, 1 x west.
										Base of the boilers (around manway, bolts etc) 1 x east, 1 x west
										Mod room (051 or 052 on the valving)
						a) Source Term Characterization				ESC (scrap pipe on platform)
						Section 2.2: Develop a strategy for taking smear samples for the purpose of source term characterization of Unit 2 when				Reach inside (do not enter) feeder cabinet on 100 elev and smear walkway
<u>564</u>			<u>5876</u>	In Progress	Strategy for smear samples to determine radionuclide characterization for U2		Johnathon Hash	Joe Cicchini	01-Apr-17	Top of Bleed condenser 107.5 elev SDC The smears were sent to the Chemistry lab for initial analysis. Lab results have been received, along with the smears. Additional alpha counting of the smears will be arranged with Kinectrics. (10 Aug; JJ) See email attachment #2 below for results of initial counts of the smears performed at the DN Chem Lab. Preparation in progress to send the smears to Kinectrics for alpha analysis. 25AUG2016 JC Smears being processed for shipment 14OCT2016 - Several smears have been processed and analyzed in previous outages this data will be used to anticipate and Unit 2 specific smears will be collected. (22 Nov; JJ) Additional smears were taken by DN RP in Unit 3 and Unit 4 in 2015/2016 outages respectively (see attachment #4 email). Together with similar legacy data (see attachment #3), attachment #4 data from U3 and 4 will be reviewed and analyzed to confirm the beta-gamma to alpha ratio to confirm the beta-gamma to alpha ratio to confirm that capability of WBMs to indicate the presence of Alpha emitting radionuclides, and the continued use of pancake meters for inference of alpha activity. (29 Dec; JJ) The above mentioned U3 & U4 smear analysis results will be reviewed by NRRP HPs to confirm beta-

<u>564</u>	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5880	In Progress	Define the policy for PAS sampling usage during U2 Refurbishment	a) Dosimetry • Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).	Johnathon Hash	Jeff Johansson	03-Apr-17	recommendations from external report are being reviewed for path forward. (7 June, JOHANSSON): Set up a meeting with HPD to discuss HTD report and its' recommendations, including this action. Discuss the following points: (i) explore option of having a representative # of workers in a crew wear PAS instead of the whole crew. (ii) explore efficiencies in the issuing paperwork to add to improvements in the chain of custody and handling at the lab during pre-processing and post-processing of the results. (iii) explore option to perform on-boarding pre-screening of workers (Note: HPD DHP has identified that this pre-screening of workers is not needed. NR-RP requires HPD to document the rationale for not performing pre-screening). (iv) Explore option for Field Section or delegate in the field to perform pre-screening of PAS samples prior to delivery to HPD, if required. If granted, what are the instrument requirements to achieve this pre-screening with appropriate QA methodologies. (14 July; JJ): Meeting with HPD was held on 13 June. It was recommended (by HPD HPM) that NR-RP prepare a DRAFT PAS Policy for HPD review. The policy should consider a graduated approach, and a systematic look into managing the risks. As for item # (iii) above, HPD DHP has issued a DRAFT report (see attachment # 1 and 2 below) for all to review and offer feedback. There is no due date specified for the review. (09 Nov; JJ) Whitby HPD (Dan Oancea) has issued the first version of the new PAS issuing form for field testing (see attachment #3 below). The intention is to have the electronic form replace the existing N-FORM-10298 so NRRP/HPD can keep track of the PAS and the associated records until final data is loaded into RIS/RDS. This new e-form is the first step in the process of transitioning from a manual fill-in form to an electronic process. There will also be a software module at the Whitby Lab to manage the PAS results and a module to allow DHPs/Rad Data to import the results
			<u>5883</u>	In Progress	Darlington Routine Radiation Surveys Instruction Modified to include Unit 2 Refurbishment	Sect 4.1.1: Modify D-INS-09071-10012, Darlington Routine Radiation Surveys, to expand the routine alpha monitoring program for Unit 2 refurbishment. Moving due date to June 30 in order to capture recommendations from an external report for Hard to Detect Nuclide Monitoring. (7 June, JOHANSSON): moved due date to Aug 31, 2016.	Johnathon Hash	Jeff Johansson	03-Apr-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. (09 Nov; JJ) The highest potential for alpha presence may occur during RFR series work (EF cutting, PT cut, etc). NRRP ALARA are preparing RFR series specific RPEGs that will include requirements for routine and non-routine alpha surveys/smears. The Darlington Routine Survey instruction will not be revised to incorporate such requirements as it is tracked under the RPEGS. (01 Feb; JJ) DRAFT Routine Survey RPEG has been issued for RP review (see attachment #1). This RPEG was discussed with the Field Section and an action was assigned to the Field Section to determine the level of effort/resources that will take to execute the proposed RPEG surveys.

	UENERATION									Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of	<u>5884</u>	In Progress	Develop a Strategy for Job Specific Non-Routine Surveys	Sect 4.1.1: A strategy for non-routine surveys for specific jobs/locations for the Unit 2 refurbishment should be developed (i.e., frequency, timing). Date changed to June 30 in order to accommodate recommendations from the hard to Detect Nuclide external report. (7 June, JOHANSSON): moved due date to Aug 31, 2016.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID Non routine surveys will be carried out as required due to work evolution/ adjacent work activities. Most areas will have transmitting portable instrumentation and real time hazard levels will be available at all times.
564 4		event during their refurbishment.	<u>5886</u>	In Progress	Confirm Alpha Counting room for Refurbishment	• Sect 4.1.1: Confirm the availability of a facility for counting alpha contamination samples.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. Explore Ryan's suggestion for NR-RP to own and operate the Darlington iSolo counting room, and offer to perform any Darlington RP smears and train their personnel as well. (July 14; JJ): In addition to securing a dedicated alpha counting room for Refurbishment work, it was suggested that HPD perform a QA program for the results by analyzing a fixed percentage of the smears collected and counted, and documenting the results in a QA report for audit purposes. This will be include in the PAS Sampling Policy that is tracked under Action #5880. 25AUG2016 JC - Refurb RP will be working with station RP to develop a smear counting strategy that will benefit both organizations. ***Initiator name changed from BurkeJ to CicchinJ due to Lan ID of burkej not being recognized.
			<u>5887</u>	In Progress	Confirm Monitoring Compliance with Alpha Contamination Limits	Sect 4.2.1/4.3.1: Confirm through ongoing source term/alpha characterization of Unit 2 that the beta-gamma: alpha activity ratio is greater than 5. This will confirm that pancake and WBM are sufficient to confirm compliance with alpha contamination limits.	Johnathon Hash	Jeff Johansson	30-Sep-17	(7 June; JJ): Consider integrating this requirement into the NR-RP Routine Survey program. If appropriate, close this action to action # 5883. (18 July; JJ): Post June 13 meeting with HPD, a recommendation was made for NR-RP to explore other instruments for Alpha counting (other than iSolos). It was also suggested to have HPD Instrument group involved in this search. (03 Oct; JJ) The recommendation is to confirm through on-going source term and/or alpha characterization studies during refurbishment activities that the betagamma: alpha ratio activity is still > 5. Once RFR work commences in unit 2, smears of open system piping/equipment will be performed and analyzed to confirm the ratios are > 5. As per current DNRU2 level 1 schedule, this work will start around July 2017 with window #42 Feeder Removal. Due date for this action has been set to Nov 2017 to confirm the ratios.

	Data Refreshed: 07-Mar-17 10:30 PM
Large Potential Worker	(7 June, JOHANSSON): Field Support
Doses due to Inadequete Contractors may be exposed to unexpected radionuclide(s)	Section to plan and execute a 3-4 week

										Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5889</u>	In Progress	Shielding for iCAMs located in high gamma background	• Sect 4.4.1: Shielding for iCAMs will be required when they are placed in high gamma background areas (i.e., on platforms near the feeders and reactor face).	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): Field Support Section to plan and execute a 3-4 week experiment testing different shielding configurations for iCAMs. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID. Investigating the use or remote head iCams for this purpose. The use of sampling hoses is also being considered. 15OCT2016 - Thermos Brand Airborne particulate monitors are being considered for their gamma background properties.
564			5890	In Progress	Shielding for WBM at U2 and RWPB	Sect 4.4.1: Shielding for WBMs at Unit 2 and RWPB should be considered and implemented if the background levels are too high for the monitors to operate effectively. TCD: October 1, 2016	Johnathon Hash	Jeff Johansson	01-Apr-17	(7 June, JJ): This work has started with the shielding considerations for the WBMs/HFFs at the RWPB. The background dose rates in the RWPB are much higher than the required background dose rates for efficient operation of the WBMs/HFFs of <50 micro-Rem/h. Some of the normal operating dose rates in the building are pegged at values > 200 micro-rem/h at locations where the monitors will be located. The Joint-Venture team are performing shielding analysis to determine the required shielding to shield the monitors with (shielding huts and/or walls) to achieve <50 micro-rem/h rates. Various locations within Unit 2 are also being investigated for shielding of the WBMs, like the south wall of the RAB side and close to where the flasks will be lowered from the RMD containing adjusters and vertical flux detectors. It is anticipated that the dose rates from the flask will take the monitors out of service during the craning time of the flasks from elevation 115m down to 100m. (22 Aug; JJ) Shielding requirements for the RWPB monitors (WBM/HFF) are being defined and designed by the JV (see attachments #1,2 & 3 for some emails on the subject). Shielding requirements for Unit 2 monitors are based on local/nearby work that may affect the local background for the monitors. To date, initial discussions have been held with the AA/VFD/HFD Replacement project team (ES Fox) and a walk down of the flask transfer route will be schedule with the project in early Sept. (03 Oct; JJ) Walk down with the ES Fox team working on the AA/VFD/HFD Replacement project was scheduled in Sept but was cancelled due to other priorities. A new walk down meeting needs to be established to walk down the path of flask transfer. RP (Jeff J) is set up a new meeting with ES Fox. (TCD: 31 Oct) (09 Nov; JJ) Walk down of the area has identified that the craning/staging area for the AA/VFD flasks is located at column line K16 - L16. The south bank of whole body monitors is located at column line A16 - B1

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a	<u>5891</u>	In Progress	Contamination Control Intiatives for RFR, RWPD and SGs	Sect 5.1: RP should review in detail the refurbishment work (e.g., CWPs for RFR in vault and RWPB, and SG work) for opportunities to reduce and control contamination spread and protection of workers against internal hazards. The outcome of this review should be documented and communicated to the Field group, HP assessors, project leaders, and REP preparers. The output from this review should be incorporated in the CWPs.	Johnathon Hash	Joe Cicchini	17-Mar-17	(June 7, JOHANSSON) Action assigned to the Field Support Section. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID
564		disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5892</u>	In Progress	Contamination Control Equipment	Sect 5.1: Confirm who is procuring/deploying/controlling contamination control equipment (e.g., vacuum cleaners with HEPA filters) for all refurbishment projects (e.g., RFR, SG, and BOP work). Met with external vendor to confirm scope of purchased services regarding Munter. External review commissioned for review of recommendations for HEPA use on the project.	Johnathon Hash	Joe Cicchini	17-Mar-17	A list of contamination control equipment and the TCD for arrival of the equipment on site has been requested of RFR. A list of contamination control equipment for Balance of Plant and SG work has been requested. All other information remains unchanged. The ownership for procurement/deployment and control of contamination control equipment among the Projects is under investigation. RFR has indicated that they are responsible for procurement of five (5) smooth bore hose Hepa vacuum cleaners; 2 - for the reactor vault, 1 for the reactor auxilliary bay and 2 for the RWPB. Arrangements will be made to assist RFR with the deployment and control of the vacuums as per the Radiation Protection Coordinator assigned to the specific task. Ownership of contamination control equipment for Balance of Plant and SG work is currently in progress and an update will be provided before 23 Feb. 2106. It has been determined that the Radiation Protection work group does not have ownership for procurement of additional contamination control equipment. The Radiation Protection department will assist with the deployment and control of "contaminated" equipment used on the projects under the guidance of the Radiation Protection Coordinators. RP may consider purchase of some equipment. Currently no CCF has been initiated however it is under review. (09 Aug; JJ) Due date changed to Sept 30, 2016. 25AUG2016 JC - A comparison between OPG sites has been initiated to develop a fleet approach to CATS devices. This exercise will produce a program that will enhance our contamination control strategy

	GENERATION									Process Owner: L. Ren Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5893</u>	In Progress	Wentilated Lents	• Sect 5.1: RP should consider the requirements for ventilated tents and exhaust HEPA filters. This will include the design and integrity testing.	Johnathon Hash	Joe Cicchini	17-Mar-17	RP for Refurbishment has considered the use of ventilated tents and exhaust HEPA units with filters. RP will utilize N-INS-03420-10005 on Use and Maintenance of Portable HEPA filter ventilation units for all hepa units used in association with vented tents. RP Refurbishment has agreed to perform the HEPA filter changes required for effective operation of the unit(s). RP Refurbishment will not purchase the HEPA units, nor does RP have budget to procure the HEPA units as this part of the "consumable" budget was given to Maintnenance Refurbishment. Ventilated tents are used to control contamination, however, there is no integrity testing procedure to date, other than the use of a smoke bomb to check the tent for air flow. An alternate source of testing tent integrity would be to use a Magnehelic guage to determine air flow. A process/procedure to perform integrity testing of tented material needs to be generated. (22 Aug; JJ) Consulted with Refurb Maintenance as to an RQE budget for RP HEPAs, Vacuums, and Munters. Tom Carvin will follow up with Mtce Manager. (15OCT2016) - Updated last reviewed date. BHI assessment procurement is in early stages. (09 Nov;JJ) BHI consultants arrived at Darlington on Nov 9. Assessment I/P.
564			<u>5894</u>	In Progress	Procedure Review and Update as Required for Refurbishment	• Sect 7.1: RP procedures (and associated forms, guides, instructions) should be reviewed and modified as necessary to ensure they are compatible with the Refurbishment RP organizational structure, work activities, and radiological conditions. A review of RP procedures will also identify readiness issues that need to be addressed by the RP refurbishment organization.	Johnathon Hash	Jeff Johansson	01-Apr-17	(03 Oct; JJ) N-PROC-RA-0020 "Preliminary Event Notification", was recently revised to accommodate a Notification Protocol for Nuclear Refurbishment Incidents at Nuclear Facilities (under a new section 1.2.5 of the procedure). RMO Action 5894 was derived from Recommendation (e) of NK38-REP-09701-0570560 Appendix I. The recommendation is to review RP Procedures to flag areas where certain references to RP organization and to the Shift Manager to ensure that Refurbishment workers know who to contact in the event of RP events. This review has been performed and the new revision of N-PROC-RA-0020 with the added notification protocol addresses this action. Furthermore, RP has created a Gap Assessment spreadsheet documenting the results of the RP Procedural reviews that was performed internally. This Gap Assessment needs to be assessed to determine what (if any) procedural changes are required. If required, then the changes must be requested via the current process of initiating a DCR in AS7. Programs Section Manager to initiate a review of the Gap Assessment with a target date of 31 Dec 2016 to create any required DCRs. (Nov 9; JJ) Work has started with respect to the review of the gap assessment to identify required changes. (29 Dec; JJ) Gap assessment review I/P. Due date changed to Apr 01, 2017 to accommodate additional time for review.

	Lama Datantial Marks	Front. There is a viel, that Niveleen Definition and annual research								Data Refreshed: 0/-Mar-1/10:30 PM
<u>564</u>	Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5895</u>	In Progress	Readiness Assessment for Hard to Detect Radionulcides	Sect 8.1: An assessment of the RP's readiness to manage hard to detect hazards should be completed prior to breaker open as well as a follow-up assessment at an appropriate time during the refurbishment.	Johnathon Hash	Jeff Johansson	31-Mar-17	(June 7, JOHANSSON): Explore and plan for a self-assessment (SA) to be performed by an Internal Team (of RP personnel). Ensure an SA entry is initiated in the Self-Assessment database for this deliverable. (Sept 13/2016: JJ) Changed due date from Sept 16 to Oct 15 as additional time is required to schedule and complete the assessment. (19 Oct: JJ) Due date extended to accommodate planning and execution of the assessment. NR RP will plan to have this assessment scheduled to be completed by end of Dec 2016. (23 Nov; JJ) A recent snapshot assessment scope of work performed by BHI (Nov 8-22) was expanded to include the subject of readiness to manage hard to detect radionuclides. This assessment report is currently being prepared and finalized and will be attached herein once completed and issued. Any gaps identified from the assessment will be tracked as actions under Risk #0564. (29 Dec; JJ) BHI draft report was submitted to OPG NRRP for review. Comments were sent back to BHI for disposition and issuance of the final report. (13 Feb; JJ) BHI Final Report has been submitted to OPG follow successful C&D process (see attachment #1 below). OPG is currently reviewing the final report with a view to initiate follow up actions to address the identified gaps and recommendations from the report.

Reconfiguration of U2 Zone 2 Coffee Shop for use as Instrument and Dosimetry Issuing Area (RaPID Center)	EVENT: The Radiation Protection Field Support Unit requires a central location to distribute dosimetry (EPDs, PASs, H&T TLDs, etc) and organize daily work activities for the Radiation Protection Co-ordinators (RPC) providing Service Protection coverage to Orange qualified RFR workers and non-RFR personnel during the Refurbishment of Unit 2. RP has been granted the old Unit 2 Coffee Shop area located on the 107.5m elevation for this purpose. There is a risk that the required renovations and conversion of the coffee shop to a dosimetry and instrument issuing center will be delayed. CAUSE: The NR RP work group had an approved SATM D-15-0310 for use of the space on U2 107.5 elevation R-203. This area was later revoked and provided to RFR as an equipment laydown area as per ECC modifications. IMPACT: The NR RP BTU Field Unit will have a trailer available in which to perform limited administrative duties, however there will not be sufficient room for all required RPCs to perform the administrative duties required to get work/PJBs performed in a timely manner to support critical path. The location of the trailer in the Unzoned area south of U2 and does not provide easy access for RFR and non-RFR projects to contact NR RP BTU. The U2 Zone 2 coffee shop is directly adjacent to the RFR PJB area and would provide excellent access to the area. Failure to provide a central location in which to issue EPDs to RFR and Project staff as well as dealing with RP related issues could cause a delay to critical path activities and extend outage windows. Additionally, the unit 2 zone 2 coffee shop has been provided to NR RP, however funding, engineering support and project lead is required to get the area ready for service by 15 Dec 2016.	4	Active	Johnathon Hash	Jeff Johansson	01-Feb-17	Mitigate	01-May-17	3 1	3 9	1	1 1	1

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.							(7 June Johansson): Initiate a search of the smears that were taken during 2015 VBO on Unit 2 and, if found, perform count on the smears and document results. (18 July; JJ) A search for the smears that were apparently taken on Unit 2 during the 2015 VBO was unsuccessful. Decision to initiate a new set of smears on Unit 4 during D1641 was made and smears were taken. Some of the areas/systems include in this smear program are (see attachment #1 below for more details):
									Floor under pressurizer x2
									Floor near ball screw pit. 1 x east, 1 x west.
									Base of the boilers (around manway, bolts etc) 1 x east, 1 x west
									Mod room (051 or 052 on the valving)
						a) Source Term Characterization			ESC (scrap pipe on platform)
						• Section 2.2: Develop a strategy for taking smear samples for the purpose of source term characterization of Unit 2 when			Reach inside (do not enter) feeder cabinet on 100 elev and smear walkway
					Ctratagu far amoar camples to	radioactive systems are opened up for refurbishment. Samples locations should include radioactive systems in Unit 2, RWPB, and Fuel Handling.			Top of Bleed condenser 107.5 elev
564			5876	In Progress	Strategy for smear samples to determine radionuclide characterization for U2	Once samples are taken, they should be analyzed radio-chemically and the conclusions with respect to dose contributions from the AMEC report should be validated. Also calculate the beta-gamma: alpha ratio to confirm capability of WBM to indicate the presence of alpha emitting radionuclides in the body and continued use of pancake for both beta-gamma measurement and, by inference, alpha presence (as per N-INS-09071-10013).	Johnathon Hash Joe Cicchir	i 01-Apr-17	The smears were sent to the Chemistry lab for initial analysis. Lab results have been received, along with the smears. Additional alpha counting of the smears will be arranged with Kinectrics. (10 Aug; JJ) See email attachment #2 below for results of initial counts of the smears performed at the DN Chem Lab. Preparation in progress to send the smears to Kinectrics for alpha analysis. 25AUG2016 JC Smears being processed for shipment 14OCT2016 - Several smears have been processed and analyzed in previous outages this data will be used to anticipate and Unit 2 specific smears will be collected. (22 Nov; JJ) Additional smears were taken by DN RP in Unit 3 and Unit 4 in 2015/2016 outages respectively (see attachment #4 email). Together with similar legacy data (see attachment #3), attachment #4 data from U3 and 4 will be reviewed and analyzed to confirm the beta-gamma to alpha ratio to confirm that capability of WBMs to indicate the presence of Alpha emitting radionuclides, and the continued use of pancake meters for inference of alpha activity. (29 Dec; JJ) The above mentioned U3 & U4 smear analysis results will be reviewed by NRRP HPs to confirm beta-

<u>564</u>	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5880	In Progress	Define the policy for PAS sampling usage during U2 Refurbishment	a) Dosimetry • Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).	Johnathon Hash	Jeff Johansson	03-Apr-17	recommendations from external report are being reviewed for path forward. (7 June, JOHANSSON): Set up a meeting with HPD to discuss HTD report and its' recommendations, including this action. Discuss the following points: (i) explore option of having a representative # of workers in a crew wear PAS instead of the whole crew. (ii) explore efficiencies in the issuing paperwork to add to improvements in the chain of custody and handling at the lab during pre-processing and post-processing of the results. (iii) explore option to perform on-boarding pre-screening of workers (Note: HPD DHP has identified that this pre-screening of workers is not needed. NR-RP requires HPD to document the rationale for not performing pre-screening). (iv) Explore option for Field Section or delegate in the field to perform pre-screening of PAS samples prior to delivery to HPD, if required. If granted, what are the instrument requirements to achieve this pre-screening with appropriate QA methodologies. (14 July; JJ): Meeting with HPD was held on 13 June. It was recommended (by HPD HPM) that NR-RP prepare a DRAFT PAS Policy for HPD review. The policy should consider a graduated approach, and a systematic look into managing the risks. As for item # (iii) above, HPD DHP has issued a DRAFT report (see attachment # 1 and 2 below) for all to review and offer feedback. There is no due date specified for the review. (09 Nov; JJ) Whitby HPD (Dan Oancea) has issued the first version of the new PAS issuing form for field testing (see attachment #3 below). The intention is to have the electronic form replace the existing N-FORM-10298 so NRRP/HPD can keep track of the PAS and the associated records until final data is loaded into RIS/RDS. This new e-form is the first step in the process of transitioning from a manual fill-in form to an electronic process. There will also be a software module at the Whitby Lab to manage the PAS results and a module to allow DHPs/Rad Data to import the results
			<u>5883</u>	In Progress	Darlington Routine Radiation Surveys Instruction Modified to include Unit 2 Refurbishment	Sect 4.1.1: Modify D-INS-09071-10012, Darlington Routine Radiation Surveys, to expand the routine alpha monitoring program for Unit 2 refurbishment. Moving due date to June 30 in order to capture recommendations from an external report for Hard to Detect Nuclide Monitoring. (7 June, JOHANSSON): moved due date to Aug 31, 2016.	Johnathon Hash	Jeff Johansson	03-Apr-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. (09 Nov; JJ) The highest potential for alpha presence may occur during RFR series work (EF cutting, PT cut, etc). NRRP ALARA are preparing RFR series specific RPEGs that will include requirements for routine and non-routine alpha surveys/smears. The Darlington Routine Survey instruction will not be revised to incorporate such requirements as it is tracked under the RPEGS. (01 Feb; JJ) DRAFT Routine Survey RPEG has been issued for RP review (see attachment #1). This RPEG was discussed with the Field Section and an action was assigned to the Field Section to determine the level of effort/resources that will take to execute the proposed RPEG surveys.

Date changed to June 30 in order to accommodate recommendations from the hard to Detect Nuclide external report. (7 June, JOHANSSON): moved due date to Aug 31, 2016.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID Non routine surveys will be carried out as required due to work evolution/ adjacent work activities. Most areas will have transmitting portable instrumentation and real time hazard levels will be available at all times.
564		event during their refurbishment.	<u>5886</u>	In Progress	Confirm Alpha Counting room fo Refurbishment	• Sect 4.1.1: Confirm the availability of a facility for counting alpha contamination samples.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. Explore Ryan's suggestion for NR-RP to own and operate the Darlington iSolo counting room, and offer to perform any Darlington RP smears and train their personnel as well. (July 14; JJ): In addition to securing a dedicated alpha counting room for Refurbishment work, it was suggested that HPD perform a QA program for the results by analyzing a fixed percentage of the smears collected and counted, and documenting the results in a QA report for audit purposes. This will be include in the PAS Sampling Policy that is tracked under Action #5880. 25AUG2016 JC - Refurb RP will be working with station RP to develop a smear counting strategy that will benefit both organizations. ***Initiator name changed from BurkeJ to CicchinJ due to Lan ID of burkej not being recognized.
			<u>5887</u>	In Progress	Confirm Monitoring Compliance with Alpha Contamination Limits	Sect 4.2.1/4.3.1: Confirm through ongoing source term/alpha characterization of Unit 2 that the beta-gamma: alpha activity ratio is greater than 5. This will confirm that pancake and WBM are sufficient to confirm compliance with alpha contamination limits.	Johnathon Hash	Jeff Johansson	30-Sep-17	(7 June; JJ): Consider integrating this requirement into the NR-RP Routine Survey program. If appropriate, close this action to action # 5883. (18 July; JJ): Post June 13 meeting with HPD, a recommendation was made for NR-RP to explore other instruments for Alpha counting (other than iSolos). It was also suggested to have HPD Instrument group involved in this search. (03 Oct; JJ) The recommendation is to confirm through on-going source term and/or alpha characterization studies during refurbishment activities that the betagamma: alpha ratio activity is still > 5. Once RFR work commences in unit 2, smears of open system piping/equipment will be performed and analyzed to confirm the ratios are > 5. As per current DNRU2 level 1 schedule, this work will start around July 2017 with window #42 Feeder Removal. Due date for this action has been set to Nov 2017 to confirm the ratios.

the subject). Shielding requirements for Unit 2 monitors are based on local/nearby work that may affect the local background for the monitors. To date, initial discussions have been held with the AA/VFD/HFD Replacement project team (ES Fox) and a walk down of the flask transfer route will be schedule with the project in

(03 Oct; JJ) Walk down with the ES Fox team working on the AA/VFD/HFD Replacement project was scheduled in Sept but was cancelled due to other priorities. A new walk down meeting needs to be established to walk down the path of flask transfer. RP (Jeff J) is set up a new meeting with ES Fox. (TCD: 31 Oct) (09 Nov; JJ) Walk down of the area has identified that the craning/staging area for the AA/VFD flasks is located at column line K16 - L16. The south bank of whole body monitors is located at column line A16 - B1

early Sept.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5889</u>	In Progress	Shielding for iCAMs located in high gamma background	• Sect 4.4.1: Shielding for iCAMs will be required when they are placed in high gamma background areas (i.e., on platforms near the feeders and reactor face).	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): Field Support Section to plan and execute a 3-4 week experiment testing different shielding configurations for iCAMs. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID. Investigating the use or remote head iCams for this purpose. The use of sampling hoses is also being considered. 15OCT2016 - Thermos Brand Airborne particulate monitors are being considered for their gamma background properties.
564			<u>5890</u>	In Progress	Shielding for WBM at U2 and RWPB	• Sect 4.4.1: Shielding for WBMs at Unit 2 and RWPB should be considered and implemented if the background levels are too high for the monitors to operate effectively. TCD: October 1, 2016	Johnathon Hash	Jeff Johansson	01-Apr-17	(7 June, JJ): This work has started with the shielding considerations for the WBMs/HFFs at the RWPB. The background dose rates in the RWPB are much higher than the required background dose rates for efficient operation of the WBMs/HFFs of <50 micro-Rem/h. Some of the normal operating dose rates in the building are pegged at values > 200 micro-rem/h at locations where the monitors will be located. The Joint-Venture team are performing shielding analysis to determine the required shielding to shield the monitors with (shielding huts and/or walls) to achieve <50 micro-rem/h rates. Various locations within Unit 2 are also being investigated for shielding of the WBMs, like the south wall of the RAB side and close to where the flasks will be lowered from the RMD containing adjusters and vertical flux detectors. It is anticipated that the dose rates from the flask will take the monitors out of service during the craning time of the flasks from elevation 115m down to 100m. (22 Aug; JJ) Shielding requirements for the RWPB monitors (WBM/HFF) are being defined and designed by the JV (see attachments #1,2 & 3 for some emails on

Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a	<u>5891</u>	In Progress	Contamination Control Intiatives for RFR, RWPD and SGs	Sect 5.1: RP should review in detail the refurbishment work (e.g., CWPs for RFR in vault and RWPB, and SG work) for opportunities to reduce and control contamination spread and protection of workers against internal hazards. The outcome of this review should be documented and communicated to the Field group, HP assessors, project leaders, and REP preparers. The output from this review should be incorporated in the CWPs.	Johnathon Hash	Joe Cicchini	17-Mar-17	(June 7, JOHANSSON) Action assigned to the Field Support Section. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID
564		disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5892	In Progress	Contamination Control Equipment	• Sect 5.1: Confirm who is procuring/deploying/controlling contamination control equipment (e.g., vacuum cleaners with HEPA filters) for all refurbishment projects (e.g., RFR, SG, and BOP work). Met with external vendor to confirm scope of purchased services regarding Munter. External review commissioned for review of recommendations for HEPA use on the project.	Johnathon Hash	Joe Cicchini	17-Mar-17	A list of contamination control equipment and the TCD for arrival of the equipment on site has been requested of RFR. A list of contamination control equipment for Balance of Plant and SG work has been requested. All other information remains unchanged. The ownership for procurement/deployment and control of contamination control equipment among the Projects is under investigation. RFR has indicated that they are responsible for procurement of five (5) smooth bore hose Hepa vacuum cleaners; 2 - for the reactor vault, 1 for the reactor auxilliary bay and 2 for the RWPB. Arrangements will be made to assist RFR with the deployment and control of the vacuums as per the Radiation Protection Coordinator assigned to the specific task. Ownership of contamination control equipment for Balance of Plant and SG work is currently in progress and an update will be provided before 23 Feb. 2106. It has been determined that the Radiation Protection work group does not have ownership for procurement of additional contamination control equipment. The Radiation Protection department will assist with the deployment and control of "contaminated" equipment used on the projects under the guidance of the Radiation Protection Coordinators. RP may consider purchase of some equipment. Currently no CCF has been initiated however it is under review. (09 Aug; JJ) Due date changed to Sept 30, 2016. 25AUG2016 JC - A comparison between OPG sites has been initiated to develop a fleet approach to CATS devices. This exercise will produce a program that will enhance our contamination control strategy

										Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5893	In Progress	Contamination Control - Ventilated Tents	Sect 5.1: RP should consider the requirements for ventilated tents and exhaust HEPA filters. This will include the design and integrity testing.	Johnathon Hash	Joe Cicchini	17-Mar-17	RP for Refurbishment has considered the use of ventilated tents and exhaust HEPA units with filters. RP will utilize N-INS-03420-10005 on Use and Maintenance of Portable HEPA filter ventilation units for all hepa units used in association with vented tents. RP Refurbishment has agreed to perform the HEPA filter changes required for effective operation of the unit(s). RP Refurbishment will not purchase the HEPA units, nor does RP have budget to procure the HEPA units as this part of the "consumable" budget was given to Maintnenance Refurbishment. Ventilated tents are used to control contamination, however, there is no integrity testing procedure to date, other than the use of a smoke bomb to check the tent for air flow. An alternate source of testing tent integrity would be to use a Magnehelic guage to determine air flow. A process/procedure to perform integrity testing of tented material needs to be generated. (22 Aug; JJ) Consulted with Refurb Maintenance as to an RQE budget for RP HEPAs, Vacuums, and Munters. Tom Carvin will follow up with Mtce Manager. (150CT2016) - Updated last reviewed date. BHI assessment procurement is in early stages. (09 Nov;JJ) BHI consultants arrived at Darlington on Nov 9. Assessment I/P.
564			<u>5894</u>	In Progress	Procedure Review and Update as Required for Refurbishment	• Sect 7.1: RP procedures (and associated forms, guides, instructions) should be reviewed and modified as necessary to ensure they are compatible with the Refurbishment RP organizational structure, work activities, and radiological conditions. A review of RP procedures will also identify readiness issues that need to be addressed by the RP refurbishment organization.	Johnathon Hash	Jeff Johansson	01-Apr-17	(03 Oct; JJ) N-PROC-RA-0020 "Preliminary Event Notification", was recently revised to accommodate a Notification Protocol for Nuclear Refurbishment Incidents at Nuclear Facilities (under a new section 1.2.5 of the procedure). RMO Action 5894 was derived from Recommendation (e) of NK38-REP-09701-0570560 Appendix I. The recommendation is to review RP Procedures to flag areas where certain references to RP organization and to the Shift Manager to ensure that Refurbishment workers know who to contact in the event of RP events. This review has been performed and the new revision of N-PROC-RA-0020 with the added notification protocol addresses this action. Furthermore, RP has created a Gap Assessment spreadsheet documenting the results of the RP Procedural reviews that was performed internally. This Gap Assessment needs to be assessed to determine what (if any) procedural changes are required. If required, then the changes must be requested via the current process of initiating a DCR in AS7. Programs Section Manager to initiate a review of the Gap Assessment with a target date of 31 Dec 2016 to create any required DCRs. (Nov 9; JJ) Work has started with respect to the review of the gap assessment to identify required changes. (29 Dec; JJ) Gap assessment review I/P. Due date changed to Apr 01, 2017 to accommodate additional time for review.

	A -1-1111	EVENT DD beet deathford the month become DD Classification										-	7 20.00		
	Additional cost for remote RP training capability in the classroom and Mock- up facility	EVENT: RP has identified the need to have some RP Simulator training administered at the Mock-Up during just-in-time RFR series training activities. There is a risk that the procurement, installation, testing, and commissioning of required RP training tools (ex: Q-Track, Teletrix) will be delayed. CAUSE: Delay in obtaining quotes and procurement of the relevant software. IMPACT: The Mock-up facility technology can replicate beam hazards which would be very beneficial to series testing and practical mock-up exposure, as well as in the training of the RPCs for RP. Delay in getting the simulators in place will impact the ability to fully integrate radiological training simulation into the RFR JIT program, and the RP Yellow/Green training of RPCs.	3	Active	Johnathon Hash	Jeff Johansson	01-Feb-17	Mitigate	01-Apr-17	3 1		6	1 1	1	1

Report Owner: L. Greenland

	1							T T		Data Refreshed: 07-Mar-17 10:30 PM
<u>867</u>	Additional cost for remote RP training capability in the classroom and Mock-up facility	EVENT: RP has identified the need to have some RP Simulator training administered at the Mock-Up during just-in-time RFR series training activities. There is a risk that the procurement, installation, testing, and commissioning of required RP training tools (ex: Q-Track, Teletrix) will be delayed. CAUSE: Delay in obtaining quotes and procurement of the relevant software. IMPACT: The Mock-up facility technology can replicate beam hazards which would be very beneficial to series testing and practical mock-up exposure, as well as in the training of the RPCs for RP. Delay in getting the simulators in place will impact the ability to fully integrate radiological training simulation into the RFR JIT program, and the RP Yellow/Green training of RPCs.	8817	In Progress	Initiate process to obtain quote from Teletrix Vendor with goal to purchase Teletrix and commissioned for use with the BTU RPC Training facility	HPD Remote Monitoring section to initiate process to obtain a quote from the Teletrix vendor. Teletrix Radiation Training Simulator is a training tool providing true to life meter readings without exposure to radiation sources. it utilizes RF remote control rather than ionizing radiation as a source, trainees experience a radiation meter's entire indicating range while learning in a safe environment that mimics real life operations. Teletrix will be a tool that can supplement the Yellow/Green badge training practical exercises.	Johnathon Hash	Jeff Johansson	30-Apr-17	(09 Aug; JJ) Action initiation. Aug 29 - met with Supply Chain. Assistance and support for SOW to address both remote classroom capabilities (DEC Mock up included). (Sep 13/2016: JJ) Ryan McConnell has prepared the Scope of Work (SOW) to support the RFP. Submitted the SOW to Supply Chain (SC) for review. Comments/feedback from Supply Chain received and are currently being incorporated. Next steps: re-submit to SC for processing of the RFP (19 Oct; JJ) Reassigned the action to Johansson, and added interested parties (Ryan McC and Joe C). Action will be delegated to Ryan to prepare the SOW and initiate MR to purchase. MR Approved Dec 16th. J-Hash (28 Dec; JJ) Ryan McConnell has prepared a draft SOW for the RFP. Currently being reviewed. (01 Feb; JJ) Training Simulation Equipment - received the RFQ's from Supply Chain for the training simulation equipment (Teletrix from Teletrix, Q-Track from IIS/Gamble, and Sim-Teq from Mirion). RP is currently reviewing the quotes from the proponents, and to provide Finance with recommendations on which to purchase.

<u>868</u>	Inventory data	survey results, to name a few) will not be as expedient as some Projects/Vendors may expect to maintain critical/near-critical path work. CAUSE: Lack of an electronic/high tech process for the input and communication of RP related information to all parties of interest. IMPACT: This will impact the ability for field update to shipping paperwork, site inventory control of radioactive storage areas, and up to the minute survey results updates on all media forums. We have a bounding vendor quote and we are working through that at present. The RFP process as well as CCF are in progress. June 30, 2016 - J. Hash - Met with Executive VP and DOM for Project. Discussed the use of a third party vendor for this service. Was challenged to seek assistance from DataGlance. This is the Vendor who secured the Electronic work Package contract through Fleet Maintenance. Engaged maintenance for contact information and support towards seeking our deliverables through DataGlance. In Progress.	8237	In Progress	Seek support for wireless applications within the RP project organization	This action will track our engagement with DataGlance to assist / provide technical support for using and integrating some wireless applications for the project within RP.	Johnathon Hash	Joe Cicchini	31-Mar-17	(09 Aug; JJ) Initiated discussions with DataGlance CFAM (see attachment 31 below). Next step is to setup a meeting with the CFAM to share NR-RP needs with the DataGlance team. (03 Oct; JJ) Need to re-establish contact with the CFAM (Ed Lei) to discuss potential application of DataGlance for RP field work coordination/management. Email sent to Ed Lei (see attachment #2) for a meeting to discuss opportunities to use DataGlance. 150CT2016 JC - JC/JJ attended a demonstration on 060CT. This initiative as many applications applicable to RP. Specifically the availability of the CITRIX network wirelessly, allowing RPC to access the computer system from the job site. (01 Feb; JJ) Further discussions with IT CIO on this and it was recommended that DataGlance network will provide limited to no advantages for RP as it is specifically written for Maintenance electronic work packages, and interfaces with Asset Suite. RP applications (such as VSDS, RIS, etc) interfaces with non Asset Suite software which DataGlance will not be able to provide. RP should consider using OPG Citrix to access OPG business LAN software by networking with the Refurbishment Unit 2 WiFi. RP is taking these recommendations under consideration.

<u>565</u>	Insufficient Qualified Radiation Protection Coordinators (BTU RPCs) to support Execution	EVENT: There is a risk that an insufficient number of qualified Radiation Protection Coordinators (RPCs) will be available to successfully provide service protection oversight for Fleet and Refurbishment radiological work that is being performed by EPC contractors. CAUSE: Due to low numbers of currently qualified BTU Trades RPC's plus attrition and insufficient training and qualification of new BTU Trades RPCs prior to execution of Refurbishment activities and opportunities with other industrial project in the province. IMPACT: May lead to schedule delays and cost overruns or could cause RP events due to lack of oversight or lack of properly experienced oversight.	<u>7672</u>	In Progress	Periodic Assessment of Factors and Conditions that may impact RPC Supply for Unit 2 Refurbishment.	Periodically assess the following factors/conditions to determine what impact, if any, on the BTU RPC supply: - Training schedule (i.e., BTU RPC Yellow/Green RP qualification training) - Attrition associated with existing pool of BTU RPCs. - Bruce Power Main Component Replacement (MCR) campaign impact on OPG BTU RPC supply and training. - other related factors/conditions that may impact the supply/demand. 14JJN2016 JC: Refurb Prerequisites OPEX has identified the practice of adjusting the work schedule to address production schedules. If this approach is going to be used for Refurb Execution, the Radiation Protection's current staffing model will be challenged to support all work. Specific changes that would affect how we provide protection could include things like changing to a 24/7 model instead of the current understood 20hrs/day schedule. Staggered lunches, and resultant the need to have continuous RP support throughout everyday will also have to be considered against our current proposed support system. (JC)02AUG2016:CCF to be presented for the installation of a shield wall inside Airlock #2 to allow access to the stairs to the 111m elevation. This CCF is inclusive of all aspects of the wall procurement and subsequent installation. Having a shield wall will open up work windows for other groups, creating more demand for Radiation Protection Support. (JC) 30SEPT2016 Training I/p. RPCs in place and ready. (JC) 29DEC Class 8 training to begin 23JAN2017, this will bring the number of RPCs up to 166 techs available.	Johnathon Hash	Joe Cicchini	15-Sep-17	This is an on-going periodic assessment action so the due and completed dates are set to the end of the Unit 2 refurbishment window. If needed, a new action can be generated for future units. (JC)08SEPT2016 4on - 4off schedule is being used to increase RPC numbers per shift and provide 24/7 coverage. This model will provide for more depth to crew sizes and the availability of workers to supplement crews (Overtime) if required. (JC)14OCT2016 Class 7 is in progress and Classes 8 and 9 are scheduled for early 2017.
			<u>8110</u>	In Progress	Review and Revisit BTU RPC Demand/Supply for Additional Yellow Badge Classes	Review and revisit BTU RPC demand/supply to determine need for additional classes.	Johnathon Hash	Joe Cicchini	31-Mar-17	25AUG2016 JC Currently, our model supports our plan. 15OCT2016 JC - Two classes are currently scheduled for 2017 (Class 8&9) the requirement for additional classes are to be determined. 16JAN2017 JH - Third class added to 2017. Currently a Q4 course is being considered by not committed at this time. Decision by end of Q1.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.						(7 June Johansson): Initiate a search of the smears that were taken during 2015 VBO on Unit 2 and, if found, perform count on the smears and document results. (18 July; JJ) A search for the smears that were apparently taken on Unit 2 during the 2015 VBO was unsuccessful. Decision to initiate a new set of smears on Unit 4 during D1641 was made and smears were taken. Some of the areas/systems include in this smear program are (see attachment #1 below for more details):
								Floor under pressurizer x2
								Floor near ball screw pit. 1 x east, 1 x west.
								Base of the boilers (around manway, bolts etc) 1 x east, 1 x west
								Mod room (051 or 052 on the valving)
						a) Source Term Characterization		ESC (scrap pipe on platform)
						Section 2.2: Develop a strategy for taking smear samples for the purpose of source term characterization of Unit 2 when		Reach inside (do not enter) feeder cabinet on 100 elev and smear walkway
						radioactive systems are opened up for refurbishment. Samples locations should include radioactive systems in Unit 2, RWPB,		Top of Bleed condenser 107.5 elev
564			<u>5876</u>	In Progress	Strategy for smear samples to determine radionuclide characterization for U2	and Fuel Handling. Once samples are taken, they should be analyzed radio-chemically and the conclusions with respect to dose contributions from the AMEC report should be validated. Also calculate the beta-gamma: alpha ratio to confirm capability of WBM to indicate the presence of alpha emitting radionuclides in the body and continued use of pancake for both beta-gamma measurement and, by inference, alpha presence (as per N-INS-09071-10013).	Johnathon Hash Joe Cicchini 01-Ap	SDC The smears were sent to the Chemistry lab for initial analysis. Lab results have been received, along with the smears. Additional alpha counting of the smears will be arranged with Kinectrics. (10 Aug; JJ) See email attachment #2 below for results of initial counts of the smears performed at the DN Chem Lab. Preparation in progress to send the smears to Kinectrics for alpha analysis. 25AUG2016 JC Smears being processed for shipment 14OCT2016 - Several smears have been processed and analyzed in previous outages this data will be used to anticipate and Unit 2 specific smears will be collected.
								(22 Nov; JJ) Additional smears were taken by DN RP in Unit 3 and Unit 4 in 2015/2016 outages respectively (see attachment #4 email). Together with similar legacy data (see attachment #3), attachment #4 data from U3 and 4 will be reviewed and analyzed to confirm the beta-gamma to alpha ratio to confirm that capability of WBMs to indicate the presence of Alpha emitting radionuclides, and the continued use of pancake meters for inference of alpha activity. (29 Dec; JJ) The above mentioned U3 & U4 smear analysis results will be reviewed by NRRP HPs to confirm beta-

<u>564</u>	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5880	In Progress	Define the policy for PAS sampling usage during U2 Refurbishment	a) Dosimetry • Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).	Johnathon Hash	Jeff Johansson	03-Apr-17	recommendations from external report are being reviewed for path forward. (7 June, JOHANSSON): Set up a meeting with HPD to discuss HTD report and its' recommendations, including this action. Discuss the following points: (i) explore option of having a representative # of workers in a crew wear PAS instead of the whole crew. (ii) explore efficiencies in the issuing paperwork to add to improvements in the chain of custody and handling at the lab during pre-processing and post-processing of the results. (iii) explore option to perform on-boarding pre-screening of workers (Note: HPD DHP has identified that this pre-screening of workers is not needed. NR-RP requires HPD to document the rationale for not performing pre-screening). (iv) Explore option for Field Section or delegate in the field to perform pre-screening of PAS samples prior to delivery to HPD, if required. If granted, what are the instrument requirements to achieve this pre-screening with appropriate QA methodologies. (14 July; JJ): Meeting with HPD was held on 13 June. It was recommended (by HPD HPM) that NR-RP prepare a DRAFT PAS Policy for HPD review. The policy should consider a graduated approach, and a systematic look into managing the risks. As for item # (iii) above, HPD DHP has issued a DRAFT report (see attachment # 1 and 2 below) for all to review and offer feedback. There is no due date specified for the review. (09 Nov; JJ) Whitby HPD (Dan Oancea) has issued the first version of the new PAS issuing form for field testing (see attachment #3 below). The intention is to have the electronic form replace the existing N-FORM-10298 so NRRP/HPD can keep track of the PAS and the associated records until final data is loaded into RIS/RDS. This new e-form is the first step in the process of transitioning from a manual fill-in form to an electronic process. There will also be a software module at the Whitby Lab to manage the PAS results and a module to allow DHPs/Rad Data to import the results
			<u>5883</u>	In Progress	Darlington Routine Radiation Surveys Instruction Modified to include Unit 2 Refurbishment	Sect 4.1.1: Modify D-INS-09071-10012, Darlington Routine Radiation Surveys, to expand the routine alpha monitoring program for Unit 2 refurbishment. Moving due date to June 30 in order to capture recommendations from an external report for Hard to Detect Nuclide Monitoring. (7 June, JOHANSSON): moved due date to Aug 31, 2016.	Johnathon Hash	Jeff Johansson	03-Apr-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. (09 Nov; JJ) The highest potential for alpha presence may occur during RFR series work (EF cutting, PT cut, etc). NRRP ALARA are preparing RFR series specific RPEGs that will include requirements for routine and non-routine alpha surveys/smears. The Darlington Routine Survey instruction will not be revised to incorporate such requirements as it is tracked under the RPEGS. (01 Feb; JJ) DRAFT Routine Survey RPEG has been issued for RP review (see attachment #1). This RPEG was discussed with the Field Section and an action was assigned to the Field Section to determine the level of effort/resources that will take to execute the proposed RPEG surveys.

Date changed to June 30 in order to accommodate recommendations from the hard to Detect Nuclide external report. (7 June, JOHANSSON): moved due date to Aug 31, 2016. 	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID Non routine surveys will be carried out as required due to work evolution/ adjacent work activities. Most areas will have transmitting portable instrumentation and real time hazard levels will be available at all times.
<u>564</u>		event during their refurbishment.	<u>5886</u>	In Progress	Confirm Alpha Counting room for Refurbishment	• Sect 4.1.1: Confirm the availability of a facility for counting alpha contamination samples.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. Explore Ryan's suggestion for NR-RP to own and operate the Darlington iSolo counting room, and offer to perform any Darlington RP smears and train their personnel as well. (July 14; JJ): In addition to securing a dedicated alpha counting room for Refurbishment work, it was suggested that HPD perform a QA program for the results by analyzing a fixed percentage of the smears collected and counted, and documenting the results in a QA report for audit purposes. This will be include in the PAS Sampling Policy that is tracked under Action #5880. 25AUG2016 JC - Refurb RP will be working with station RP to develop a smear counting strategy that will benefit both organizations. ***Initiator name changed from BurkeJ to CicchinJ due to Lan ID of burkej not being recognized.
			<u>5887</u>	In Progress	Confirm Monitoring Compliance with Alpha Contamination Limits	Sect 4.2.1/4.3.1: Confirm through ongoing source term/alpha characterization of Unit 2 that the beta-gamma: alpha activity ratio is greater than 5. This will confirm that pancake and WBM are sufficient to confirm compliance with alpha contamination limits.	Johnathon Hash	Jeff Johansson	30-Sep-17	(7 June; JJ): Consider integrating this requirement into the NR-RP Routine Survey program. If appropriate, close this action to action # 5883. (18 July; JJ): Post June 13 meeting with HPD, a recommendation was made for NR-RP to explore other instruments for Alpha counting (other than iSolos). It was also suggested to have HPD Instrument group involved in this search. (03 Oct; JJ) The recommendation is to confirm through on-going source term and/or alpha characterization studies during refurbishment activities that the betagamma: alpha ratio activity is still > 5. Once RFR work commences in unit 2, smears of open system piping/equipment will be performed and analyzed to confirm the ratios are > 5. As per current DNRU2 level 1 schedule, this work will start around July 2017 with window #42 Feeder Removal. Due date for this action has been set to Nov 2017 to confirm the ratios.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public	<u>5889</u>	In Progress	Shielding for iCAMs located in high gamma background	 Sect 4.4.1: Shielding for iCAMs will be required when they are placed in high gamma background areas (i.e., on platforms near the feeders and reactor face). 	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): Field Support Section to plan and execute a 3-4 week experiment testing different shielding configurations for iCAMs. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID. Investigating the use or remote head iCams for this purpose. The use of sampling hoses is also being
		and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.								considered. 150CT2016 - Thermos Brand Airborne particulate monitors are being considered for their gamma background properties.
564			5890	In Progress	Shielding for WBM at U2 and RWPB	• Sect 4.4.1: Shielding for WBMs at Unit 2 and RWPB should be considered and implemented if the background levels are too high for the monitors to operate effectively. TCD: October 1, 2016	Johnathon Hash	Jeff Johansson	01-Apr-17	(7 June, JJ): This work has started with the shielding considerations for the WBMs/HFFs at the RWPB. The background dose rates in the RWPB are much higher than the required background dose rates for efficient operation of the WBMs/HFFs of <50 micro-Rem/h. Some of the normal operating dose rates in the building are pegged at values > 200 micro-rem/h at locations where the monitors will be located. The Joint-Venture team are performing shielding analysis to determine the required shielding to shield the monitors with (shielding huts and/or walls) to achieve <50 micro-rem/h rates. Various locations within Unit 2 are also being investigated for shielding of the WBMs, like the south wall of the RAB side and close to where the flasks will be lowered from the RMD containing adjusters and vertical flux detectors. It is anticipated that the dose rates from the flask will take the monitors out of service during the craning time of the flasks from elevation 115m down to 100m. (22 Aug; JJ) Shielding requirements for the RWPB monitors (WBM/HFF) are being defined and designed by the JV (see attachments #1,2 & 3 for some emails on the subject). Shielding requirements for Unit 2 monitors are based on local/nearby work that may affect the local background for the monitors. To date, initial discussions have been held with the AA/VFD/HFD Replacement project team (ES Fox) and a walk down of the flask transfer route will be schedule with the project in early Sept. (03 Oct; JJ) Walk down with the ES Fox team working on the AA/VFD/HFD Replacement project was scheduled in Sept but was cancelled due to other priorities. A new walk down meeting needs to be established to walk down the path of flask transfer. RP (Jeff J) is set up a new meeting with ES Fox. (TCD: 31 Oct) (09 Nov; JJ) Walk down of the area has identified that the craning/staging area for the AA/VFD flasks is located at column line K16 - L16. The south bank of whole body monitors is located at column line A16 - B1

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a	<u>5891</u>	In Progress	Contamination Control Intiatives for RFR, RWPD and SGs	• Sect 5.1: RP should review in detail the refurbishment work (e.g., CWPs for RFR in vault and RWPB, and SG work) for opportunities to reduce and control contamination spread and protection of workers against internal hazards. The outcome of this review should be documented and communicated to the Field group, HP assessors, project leaders, and REP preparers. The output from this review should be incorporated in the CWPs.	Johnathon Hash	Joe Cicchini	17-Mar-17	(June 7, JOHANSSON) Action assigned to the Field Support Section. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID
<u>564</u>		disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5892</u>	In Progress	Contamination Control Equipment	• Sect 5.1: Confirm who is procuring/deploying/controlling contamination control equipment (e.g., vacuum cleaners with HEPA filters) for all refurbishment projects (e.g., RFR, SG, and BOP work). Met with external vendor to confirm scope of purchased services regarding Munter. External review commissioned for review of recommendations for HEPA use on the project.	Johnathon Hash	Joe Cicchini	17-Mar-17	23 Feb. 16 A list of contamination control equipment and the TCD for arrival of the equipment on site has been requested of RFR. A list of contamination control equipment for Balance of Plant and SG work has been requested. All other information remains unchanged. The ownership for procurement/deployment and control of contamination control equipment among the Projects is under investigation. RFR has indicated that they are responsible for procurement of five (5) smooth bore hose Hepa vacuum cleaners; 2 - for the reactor vault, 1 for the reactor auxilliary bay and 2 for the RWPB. Arrangements will be made to assist RFR with the deployment and control of the vacuums as per the Radiation Protection Coordinator assigned to the specific task. Ownership of contamination control equipment for Balance of Plant and SG work is currently in progress and an update will be provided before 23 Feb. 2106. It has been determined that the Radiation Protection work group does not have ownership for procurement of additional contamination control equipment. The Radiation Protection department will assist with the deployment and control of "contaminated" equipment used on the projects under the guidance of the Radiation Protection Coordinators. RP may consider purchase of some equipment. Currently no CCF has been initiated however it is under review. (09 Aug; JJ) Due date changed to Sept 30, 2016. 25AUG2016 JC - A comparison between OPG sites has been initiated to develop a fleet approach to CATS devices. This exercise will produce a program that will enhance our contamination control strategy

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5893</u>	In Progress	Contamination Control - Ventilated Tents	• Sect 5.1: RP should consider the requirements for ventilated tents and exhaust HEPA filters. This will include the design and integrity testing. Johnathon Hash	Joe Cicchini	17-Mar-17	RP for Refurbishment has considered the use of ventilated tents and exhaust HEPA units with filters. RP will utilize N-INS-03420-10005 on Use and Maintenance of Portable HEPA filter ventilation units for all hepa units used in association with vented tents. RP Refurbishment has agreed to perform the HEPA filter changes required for effective operation of the unit(s). RP Refurbishment will not purchase the HEPA units,nor does RP have budget to procure the HEPA units as this part of the "consumable" budget was given to Maintnenance Refurbishment. Ventilated tents are used to control contamination, however, there is no integrity testing procedure to date, other than the use of a smoke bomb to check the tent for air flow. An alternate source of testing tent integrity would be to use a Magnehelic guage to determine air flow. A process/procedure to perform integrity testing of tented material needs to be generated. (22 Aug; JJ) Consulted with Refurb Maintenance as to an RQE budget for RP HEPAs, Vacuums, and Munters. Tom Carvin will follow up with Mtce Manager. (150CT2016) - Updated last reviewed date. BHI assessment procurement is in early stages. (09 Nov;JJ) BHI consultants arrived at Darlington on Nov 9. Assessment I/P.
564			5894	In Progress	Procedure Review and Update as Required for Refurbishment	• Sect 7.1: RP procedures (and associated forms, guides, instructions) should be reviewed and modified as necessary to ensure they are compatible with the Refurbishment RP organizational structure, work activities, and radiological conditions. A review of RP procedures will also identify readiness issues that need to be addressed by the RP refurbishment organization.	n Jeff Johansson	01-Apr-17	(03 Oct; JJ) N-PROC-RA-0020 "Preliminary Event Notification", was recently revised to accommodate a Notification Protocol for Nuclear Refurbishment Incidents at Nuclear Facilities (under a new section 1.2.5 of the procedure). RMO Action 5894 was derived from Recommendation (e) of NK38-REP-09701-0570560 Appendix I. The recommendation is to review RP Procedures to flag areas where certain references to RP organization and to the Shift Manager to ensure that Refurbishment workers know who to contact in the event of RP events. This review has been performed and the new revision of N-PROC-RA-0020 with the added notification protocol addresses this action. Furthermore, RP has created a Gap Assessment spreadsheet documenting the results of the RP Procedural reviews that was performed internally. This Gap Assessment needs to be assessed to determine what (if any) procedural changes are required. If required, then the changes must be requested via the current process of initiating a DCR in AS7. Programs Section Manager to initiate a review of the Gap Assessment with a target date of 31 Dec 2016 to create any required DCRs. (Nov 9; JJ) Work has started with respect to the review of the gap assessment to identify required changes. (29 Dec; JJ) Gap assessment review I/P. Due date changed to Apr 01, 2017 to accommodate additional time for review.

<u>564</u>	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5895	In Progress	Readiness Assessment for Hard to Detect Radionulcides	Sect 8.1: An assessment of the RP's readiness to manage hard to detect hazards should be completed prior to breaker open as well as a follow-up assessment at an appropriate time during the refurbishment.	Johnathon Hash	Jeff Johansson	31-Mar-17	(June 7, JOHANSSON): Explore and plan for a self-assessment (SA) to be performed by an Internal Team (of RP personnel). Ensure an SA entry is initiated in the Self-Assessment database for this deliverable. (Sept 13/2016: JJ) Changed due date from Sept 16 to Oct 15 as additional time is required to schedule and complete the assessment. (19 Oct: JJ) Due date extended to accommodate planning and execution of the assessment. NR RP will plan to have this assessment scheduled to be completed by end of Dec 2016. (23 Nov; JJ) A recent snapshot assessment scope of work performed by BHI (Nov 8-22) was expanded to include the subject of readiness to manage hard to detect radionuclides. This assessment report is currently being prepared and finalized and will be attached herein once completed and issued. Any gaps identified from the assessment will be tracked as actions under Risk #0564. (29 Dec; JJ) BHI draft report was submitted to OPG NRRP for review. Comments were sent back to BHI for disposition and issuance of the final report. (13 Feb; JJ) BHI Final Report has been submitted to OPG follow successful C&D process (see attachment #1 below). OPG is currently reviewing the final report with a view to initiate follow up actions to address the identified gaps and recommendations from the report.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.				 a) Source Term Characterization Section 2.2: Develop a strategy for taking smear samples for the purpose of source term characterization of Unit 2 when radioactive systems are opened up for refurbishment. Samples 				7 June Johansson): Initiate a search of the smears that were taken during 2015 VBO on Unit 2 and, if found, perform count on the smears and document results. (18 July; JJ) A search for the smears that were apparently taken on Unit 2 during the 2015 VBO was unsuccessful. Decision to initiate a new set of smears on Unit 4 during D1641 was made and smears were taken. Some of the areas/systems include in this smear program are (see attachment #1 below for more details): Floor under pressurizer x2 Floor near ball screw pit. 1 x east, 1 x west. Base of the boilers (around manway, bolts etc) 1 x east, 1 x west Mod room (051 or 052 on the valving) ESC (scrap pipe on platform) Reach inside (do not enter) feeder cabinet on 100 elev and smear walkway
<u>564</u>			<u>5876</u>	In Progress	Strategy for smear samples to determine radionuclide characterization for U2	locations should include radioactive systems in Unit 2, RWPB, and Fuel Handling. Once samples are taken, they should be analyzed radiochemically and the conclusions with respect to dose contributions from the AMEC report should be validated. Also calculate the beta-gamma: alpha ratio to confirm capability of WBM to indicate the presence of alpha emitting radionuclides in the body and continued use of pancake for both beta-gamma measurement and, by inference, alpha presence (as per N-INS-09071-10013).	Johnathon Hash	Joe Cicchini	01-Apr-17	SDC The smears were sent to the Chemistry lab for initial analysis. Lab results have been received, along with the smears. Additional alpha counting of the smears will be arranged with Kinectrics. (10 Aug; JJ) See email attachment #2 below for results of initial counts of the smears performed at the DN Chem Lab. Preparation in progress to send the smears to Kinectrics for alpha analysis. 25AUG2016 JC Smears being processed for shipment 14OCT2016 - Several smears have been processed and analyzed in previous outages this data will be used to anticipate and Unit 2 specific smears will be collected. (22 Nov; JJ) Additional smears were taken by DN RP in Unit 3 and Unit 4 in 2015/2016 outages respectively (see attachment #4 email). Together with similar legacy data (see attachment #3), attachment #4 data from U3 and 4 will be reviewed and analyzed to confirm the beta-gamma to alpha ratio to confirm that capability of WBMs to indicate the presence of Alpha emitting radionuclides, and the continued use of pancake meters for inference of alpha activity. (29 Dec; JJ) The above mentioned U3 & U4 smear analysis results will be reviewed by NRRP HPs to confirm beta-

Process Owner: L. Ren

<u>564</u>	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5880</u>	In Progress	Define the policy for PAS sampling usage during U2 Refurbishment	a) Dosimetry Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).	Johnathon Hash	Jeff Johansson	03-Apr-17	recommendations from external report are being reviewed for path forward. (7 June, JOHANSSON): Set up a meeting with HPD to discuss HTD report and its' recommendations, including this action. Discuss the following points: (i) explore option of having a representative # of workers in a crew wear PAS instead of the whole crew. (ii) explore efficiencies in the issuing paperwork to add to improvements in the chain of custody and handling at the lab during pre-processing and post-processing of the results. (iii) explore option to perform on-boarding pre-screening of workers (Note: HPD DHP has identified that this pre-screening of workers is not needed. NR-RP requires HPD to document the rationale for not performing pre-screening). (iv) Explore option for Field Section or delegate in the field to perform pre-screening of PAS samples prior to delivery to HPD, if required. If granted, what are the instrument requirements to achieve this pre-screening with appropriate QA methodologies. (14 July; JJ): Meeting with HPD was held on 13 June. It was recommended (by HPD HPM) that NR-RP prepare a DRAFT PAS Policy for HPD review. The policy should consider a graduated approach, and a systematic look into managing the risks. As for item # (iii) above, HPD DHP has issued a DRAFT report (see attachment # 1 and 2 below) for all to review and offer feedback. There is no due date specified for the review. (09 Nov; JJ) Whitby HPD (Dan Oancea) has issued the first version of the new PAS issuing form for field testing (see attachment #3 below). The intention is to have the electronic form replace the existing N-FORM-10298 so NRRP/HPD can keep track of the PAS and the associated records until final data is loaded into RIS/RDS. This new e-form is the first step in the process of transitioning from a manual fill-in form to an electronic process. There will also be a software module at the Whitby Lab to manage the PAS results and a module to allow DHPs/Rad Data to import the results
		<u>5883</u>	In Progress	Darlington Routine Radiation Surveys Instruction Modified to include Unit 2 Refurbishment	 Sect 4.1.1: Modify D-INS-09071-10012, Darlington Routine Radiation Surveys, to expand the routine alpha monitoring program for Unit 2 refurbishment. Moving due date to June 30 in order to capture recommendations from an external report for Hard to Detect Nuclide Monitoring. (7 June, JOHANSSON): moved due date to Aug 31, 2016. 	Johnathon Hash	Jeff Johansson	03-Apr-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. (09 Nov; JJ) The highest potential for alpha presence may occur during RFR series work (EF cutting, PT cut, etc). NRRP ALARA are preparing RFR series specific RPEGs that will include requirements for routine and non-routine alpha surveys/smears. The Darlington Routine Survey instruction will not be revised to incorporate such requirements as it is tracked under the RPEGS. (01 Feb; JJ) DRAFT Routine Survey RPEG has been issued for RP review (see attachment #1). This RPEG was discussed with the Field Section and an action was assigned to the Field Section to determine the level of effort/resources that will take to execute the proposed RPEG surveys.

										Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5884</u>	In Progress	Develop a Strategy for Job Specific Non-Routine Surveys	 Sect 4.1.1: A strategy for non-routine surveys for specific jobs/locations for the Unit 2 refurbishment should be developed (i.e., frequency, timing). Date changed to June 30 in order to accommodate recommendations from the hard to Detect Nuclide external report. (7 June, JOHANSSON): moved due date to Aug 31, 2016. 	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID Non routine surveys will be carried out as required due to work evolution/ adjacent work activities. Most areas will have transmitting portable instrumentation and real time hazard levels will be available at all times.
<u>564</u>			<u>5886</u>	In Progress	Confirm Alpha Counting room fo Refurbishment	• Sect 4.1.1: Confirm the availability of a facility for counting alpha contamination samples.	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): moved due date to Aug 31, 2016. Explore Ryan's suggestion for NR-RP to own and operate the Darlington iSolo counting room, and offer to perform any Darlington RP smears and train their personnel as well. (July 14; JJ): In addition to securing a dedicated alpha counting room for Refurbishment work, it was suggested that HPD perform a QA program for the results by analyzing a fixed percentage of the smears collected and counted, and documenting the results in a QA report for audit purposes. This will be include in the PAS Sampling Policy that is tracked under Action #5880. 25AUG2016 JC - Refurb RP will be working with station RP to develop a smear counting strategy that will benefit both organizations. ***Initiator name changed from BurkeJ to CicchinJ due to Lan ID of burkej not being recognized.
			<u>5887</u>	In Progress	Confirm Monitoring Compliance with Alpha Contamination Limits		Johnathon Hash	Jeff Johansson	30-Sep-17	(7 June; JJ): Consider integrating this requirement into the NR-RP Routine Survey program. If appropriate, close this action to action # 5883. (18 July; JJ): Post June 13 meeting with HPD, a recommendation was made for NR-RP to explore other instruments for Alpha counting (other than iSolos). It was also suggested to have HPD Instrument group involved in this search. (03 Oct; JJ) The recommendation is to confirm through on-going source term and/or alpha characterization studies during refurbishment activities that the betagamma: alpha ratio activity is still > 5. Once RFR work commences in unit 2, smears of open system piping/equipment will be performed and analyzed to confirm the ratios are > 5. As per current DNRU2 level 1 schedule, this work will start around July 2017 with window #42 Feeder Removal. Due date for this action has been set to Nov 2017 to confirm the ratios.

	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5889</u>	In Progress	Shielding for iCAMs located in high gamma background	 Sect 4.4.1: Shielding for iCAMs will be required when they are placed in high gamma background areas (i.e., on platforms near the feeders and reactor face). 	Johnathon Hash	Joe Cicchini	17-Mar-17	(7 June, JOHANSSON): Field Support Section to plan and execute a 3-4 week experiment testing different shielding configurations for iCAMs. 25AUG2016 - Initiator name changed from burkej to cicchinj due to burkej not be recognized as a lan ID. Investigating the use or remote head iCams for this purpose. The use of sampling hoses is also being considered. 15OCT2016 - Thermos Brand Airborne particulate monitors are being considered for their gamma background properties.
564			5890	In Progress	Shielding for WBM at U2 and RWPB	• Sect 4.4.1: Shielding for WBMs at Unit 2 and RWPB should be considered and implemented if the background levels are too high for the monitors to operate effectively. TCD: October 1, 2016	Johnathon Hash	Jeff Johansson	01-Apr-17	(7 June, JJ): This work has started with the shielding considerations for the WBMs/HFFs at the RWPB. The background dose rates in the RWPB are much higher than the required background dose rates for efficient operation of the WBMs/HFFs of <50 micro-Rem/h. Some of the normal operating dose rates in the building are pegged at values > 200 micro-rem/h at locations where the monitors will be located. The Joint-Venture team are performing shielding analysis to determine the required shielding to shield the monitors with (shielding huts and/or walls) to achieve <50 micro-rem/h rates. Various locations within Unit 2 are also being investigated for shielding of the WBMs, like the south wall of the RAB side and close to where the flasks will be lowered from the RMD containing adjusters and vertical flux detectors. It is anticipated that the dose rates from the flask will take the monitors out of service during the craning time of the flasks from elevation 115m down to 100m. (22 Aug; JJ) Shielding requirements for the RWPB monitors (WBM/HFF) are being defined and designed by the JV (see attachments #1,2 & 3 for some emails on the subject). Shielding requirements for Unit 2 monitors are based on local/nearby work that may affect the local background for the monitors. To date, initial discussions have been held with the AA/VFD/HFD Replacement project team (ES Fox) and a walk down of the flask transfer route will be schedule with the project in early Sept. (03 Oct; JJ) Walk down with the ES Fox team working on the AA/VFD/HFD Replacement project was scheduled in Sept but was cancelled due to other priorities. A new walk down meeting needs to be established to walk down the path of flask transfer. RP (Jeff J) is set up a new meeting with ES Fox. (TCD: 31 Oct) (09 Nov; JJ) Walk down of the area has identified that the craning/staging area for the AA/VFD flasks is located at column line K16 - L16. The south bank of whole body monitors is located at column line A16 - B1

564		disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	<u>5892</u>	In Progress	Contamination Control Equipment	• Sect 5.1: Confirm who is procuring/deploying/controlling contamination control equipment (e.g., vacuum cleaners with HEPA filters) for all refurbishment projects (e.g., RFR, SG, and BOP work). Met with external vendor to confirm scope of purchased services regarding Munter. External review commissioned for review of recommendations for HEPA use on the project.	Johnathon Hash	Joe Cicchini	17-Mar-17	23 Feb. 16 A list of contamination control equipment and the TCD for arrival of the equipment on site has been requested of RFR. A list of contamination control equipment for Balance of Plant and SG work has been requested. All other information remains unchanged. The ownership for procurement/deployment and control of contamination control equipment among the Projects is under investigation. RFR has indicated that they are responsible for procurement of five (5) smooth bore hose Hepa vacuum cleaners; 2 - for the reactor vault, 1 for the reactor auxilliary bay and 2 for the RWPB. Arrangements will be made to assist RFR with the deployment and control of the vacuums as per the Radiation Protection Coordinator assigned to the specific task. Ownership of contamination control equipment for Balance of Plant and SG work is currently in progress and an update will be provided before 23 Feb. 2106. It has been determined that the Radiation Protection work group does not have ownership for procurement of additional contamination control equipment. The Radiation Protection department will assist with the deployment and control of "contaminated" equipment used on the projects under the guidance of the Radiation Protection Coordinators. RP may consider purchase of some equipment. Currently no CCF has been initiated however it is under review. (09 Aug; JJ) Due date changed to Sept 30, 2016. 25AUG2016 JC - A comparison between OPG sites has been initiated to develop a fleet approach to CATS devices. This exercise will produce a program that will enhance our contamination control strategy

Process Owner: L. Ren

										Data Refreshed: 07-Mar-17 10:30 PM
	Large Potential Worker Doses due to Inadequete Internal (Alpha etc.) Hazard Characterization and Management	Event: There is a risk that Nuclear Refurbishment employees or Contractors may be exposed to unexpected radionuclide(s) which may lead to significant dose assignment. Cause: Inadequate source term characterization leading to radiological work planning, protective actions and dosimetry requirements not properly identified to protect workers from the hazards present. Impact: This may potentially result in high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment.	5893	In Progress	Contamination Control - Ventilated Tents	Sect 5.1: RP should consider the requirements for ventilated tents and exhaust HEPA filters. This will include the design and integrity testing.	Johnathon Hash	Joe Cicchini	17-Mar-17	RP for Refurbishment has considered the use of ventilated tents and exhaust HEPA units with filters. RP will utilize N-INS-03420-10005 on Use and Maintenance of Portable HEPA filter ventilation units for all hepa units used in association with vented tents. RP Refurbishment has agreed to perform the HEPA filter changes required for effective operation of the unit(s). RP Refurbishment will not purchase the HEPA units, nor does RP have budget to procure the HEPA units as this part of the "consumable" budget was given to Maintnenance Refurbishment. Ventilated tents are used to control contamination, however, there is no integrity testing procedure to date, other than the use of a smoke bomb to check the tent for air flow. An alternate source of testing tent integrity would be to use a Magnehelic guage to determine air flow. A process/procedure to perform integrity testing of tented material needs to be generated. (22 Aug; JJ) Consulted with Refurb Maintenance as to an RQE budget for RP HEPAs, Vacuums, and Munters. Tom Carvin will follow up with Mtce Manager. (150CT2016) - Updated last reviewed date. BHI assessment procurement is in early stages. (09 Nov;JJ) BHI consultants arrived at Darlington on Nov 9. Assessment I/P.
564			<u>5894</u>	In Progress	Procedure Review and Update as Required for Refurbishment	• Sect 7.1: RP procedures (and associated forms, guides, instructions) should be reviewed and modified as necessary to ensure they are compatible with the Refurbishment RP organizational structure, work activities, and radiological conditions. A review of RP procedures will also identify readiness issues that need to be addressed by the RP refurbishment organization.	Johnathon Hash	Jeff Johansson	01-Apr-17	(03 Oct; JJ) N-PROC-RA-0020 "Preliminary Event Notification", was recently revised to accommodate a Notification Protocol for Nuclear Refurbishment Incidents at Nuclear Facilities (under a new section 1.2.5 of the procedure). RMO Action 5894 was derived from Recommendation (e) of NK38-REP-09701-0570560 Appendix I. The recommendation is to review RP Procedures to flag areas where certain references to RP organization and to the Shift Manager to ensure that Refurbishment workers know who to contact in the event of RP events. This review has been performed and the new revision of N-PROC-RA-0020 with the added notification protocol addresses this action. Furthermore, RP has created a Gap Assessment spreadsheet documenting the results of the RP Procedural reviews that was performed internally. This Gap Assessment needs to be assessed to determine what (if any) procedural changes are required. If required, then the changes must be requested via the current process of initiating a DCR in AS7. Programs Section Manager to initiate a review of the Gap Assessment with a target date of 31 Dec 2016 to create any required DCRs. (Nov 9; JJ) Work has started with respect to the review of the gap assessment to identify required changes. (29 Dec; JJ) Gap assessment review I/P. Due date changed to Apr 01, 2017 to accommodate additional time for review.

	Availability of DN	Event: Insufficient authorized staff (certified Authorized Nuclear	4	Active	Boris Vulanovic	Ross Mccord	28-Feb-17	Mitigate	02-Apr-17	5 1 2 10 2 1 2 4
	Authorized Staff for Station and Refurb	Operator (ANO), Control Room Shift Supervisors (CRSS) and Shift Managers (SM)) staff (2013-2017) and Non-Licensed	Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments
677	Support	Operator (NLO) staff (2013 > 2020) to support Operations (outage, On-Line work (IPG), Emergent Work (FIN), procedures, training) and Refurbishment planning and execution. Causes: 1) Attrition due to retirements of ANO, CRSS/SM, NLO and Authorized Training Staff (ATS) due to demographic pool. 2) ANO initial training program throughput has historically been lower than the 60.0% previously assumed. 3) CRSS initial training previously have not been successful in producing new candidates for two (2) consecutive groups. 4) Lack of Authorization Training program-ready candidates has resulted in 40% to 50% smaller than Business Plan class sizes causing refloat to NR OM&A budget for ANOITs. 5) Knowledge gap between NLO and ANO In Training (ANOIT) results in lower entry calibre. 6) Shortages in Authorized Training Staff (ATS) to support ANO recovery plan needs. The risk is compounded by a high reliance on augmented staff to support a recovery plan and operate the business. Impact: This has the potential to impact on refurbishment planning and execution, Unit outages and VBO durations, efficiency of FIN and IPG, support for Authorization Training and backlogs in Ops Procedure.	9964	Draft	Monitoring Transition Plan Initiatives related to Authorized Staff Resources	The latest strategies for this risk mitigation involves several initiatives being put into play that will assist in meeting short term goals in keeping the work flowing until sufficient authorized staff are available to staff the refurb. department as per the Transition Plan. these initiatives are as follows 1) Reduce ANO minimum scheduled compliment to 7 from the current 8. This will allow 3 ANO's to be transferred to the refurb project (negotiated with the station). Additionally this will focus the duty crew on completing the co piloting of the 5 new ANOIT's in a timely fashion as it creates an urgency that would not otherwise exist allowing for a protracted co pilot period. This action is to take place in the first week of Jan 2017 2) Complete the co piloting of 4 SSIT's (TCD end of March 2017). This will free up 4 CRSS's to fill the need in the refurb organization. Additionally this will allow current CRSS's to co pilot in the SM position 3) For the upcoming work load peak created by the early completion of the defuel program the station has agreed to deploy the SDQ (special duty qual) NO's from the defuel campaign to the refurb project. Effectively this augments the A-E refurb shift crew by 2 NO's per crew or 10 NO's total. 4) as a stop gap measure Refurb has obtained 2 year contract extension for 6 of it's previously authorized personnel. This will secure our ability to support the review and approval of vendor documentation. 5) DORT / NORT meetings continue on a regular basis. These meeting provide a form for assigning / dividing available resources both licensed and non licensed to ensure station and refurb priorities are met	Boris Vulanovic	Michael O'dowd	20-Mar-17

<u>761</u>	Failure to obtain approval for early HTS Fill	Event: Maintaining current U2EE (P50 and P90) is predicated on filling HTS prior to containment restoration. Cause: At the Operational Decision Meeting (ODM) on June 1st, conditional approval (only) was obtained to allow filling the HTS prior to the restoration of the normal containment boundary. Conditions of approval include follow-up nuclear safety analysis and CNSC approval for a minor revision to an OP&P. Impact: Failure to meet these conditions would add approximately 43 days to the lead-out logic for each unit.	5390	In Progress	Impact of non-tritium HTS radionuclides	Ensure that spill analysis for the HTS fill scenario includes an assessment of the effect of entrained contaminants or provides a limiting value.	Gerry Martin 17-Apr-17	Analysis for the D2O contingency storage project is being reviewed to determine if that analysis can be used to respond to this action. Quantification of what possible contaminants could be present in the PHT coolant may prove difficult and would need some bounding assumptions. The present analysis assumed dose came from tritium gas escaping the reactor vault, and did not assume any liquids escape. Solid contaminants would not likely escape from the vault as they are heavy, non-soluble and would stay with the liquid, and not exit the RV with the tritium gas. C-14 may be presents, but typically, the dose from tritium is 7 times that from C-14 for scenarios such as this one. TCD extended to Jan 15, 2016 to allow for D2O storage tank work to be completed and finalized to determine applicability to this situation. Restart HIT team formed, meetings being held to narrow down the correct questions to ask contractors to complete the analysis. Contract for the analysis is not yet in-place as scope of required analysis and initial conditions are still being developed. action extended till March 30th - Gerry Martin Jan 8th, 2016 Contract being finalized as scope was recently clarified, no firm TCD from signed contract available, action extended till Aug 30, 2016 - Gerry Martin March 24, 2016 Analysis now underway, new TCD set at Nov 30th, 2016 as work was delayed while scope frozen, computer models were created and required inputs were obtained - Gerry Martin Aug 26, 2016 Analysis is still in progress, and not scheduled to be complete until the new year before it can be reviewed and enter the comment disposition cycle, TCD extended till Feb 15, 2017 - Gerry Martin Nov 11, 2017 Analysis continues to be in progress, but is taking longer than anticipated.
