Dear Ms. Marconi,

**Re: Generic Hearing on Uniform Transmission Rates-Related Issues and the
Export Transmission Service Rate
Ontario Energy Board File No.: EB-2021-0243**

Pursuant to Procedural Order #2 dated April 1, 2022, the Independent Electricity System Operator ("IESO") is writing to file its responses to the undertakings provided by the IESO panel from the Technical Conference on July 28th and July 29th.

Please contact George Dimitropoulos, Senior Advisor, Regulator Affairs at George.dimitropoulos@ieso.ca if you have any questions.

Yours truly,

Devon Huber
Director, Regulatory Affairs & Market Rules

cc: Mr. Patrick Duffy Stikeman Elliott LLP (email)
All EB-2021-0243 Intervenors (email)

Undertaking: To file or provide a link to the Brattle Report.

Response:

The 2019 Brattle report 'Analysis of the TRCA Surplus Allocation Methodology' is provided as Attachment 1 to this undertaking.

The report can also be found through the following public link, <https://www.ieso.ca/-/media/Files/IESO/Document-Library/engage/mdag/mdag-20191004-Analysis-of-the-TRCA-Surplus.ashx>.

UNDERTAKING JT-1.7

Reference: Exhibit I-01-01 - OEB Staff Interrogatory 1 Attachment 1

Undertaking: IESO to reconcile Table 16 and Table 8 in the response to OEB Staff Interrogatory 1, Attachment 1.

Response:

The ‘Export Congestion Rent’ rows in Table 8 and the “ICP Revenue” rows in Table 16 should match. However, Tables 13 to 16 incorrectly displayed the “ICP amounts paid to transmission rights holders” value in the “ICP revenue” rows. The “Volume” values were subsequently based on the amount of transmission rights owned and not the volume of exports across the line at the time of congestion. See below for the corrected tables.

Table 13 – Revenue, Volume and Number of Hours of ICP at each intertie – ICP >= 4.69/MWh

	Year	2017	2018	2019	2020	2021
Michigan	ICP Revenue (\$M)	139.4	121.9	101.6	83.1	105.8
	Volume (TWh)	6	5.3	5.9	6.1	5.1

4

5
6 **Undertaking:** IESO to look to provide a version of Table 23 without Exports, if it can.
7

8 **Response:**

9
10 The IESO is of the view that producing a version of Table 23 without exports is not realistic. The
11 data provided in Table 23 - Surplus Baseload Generation (SBG) from 2014-2021 are actual
12 curtailed energy values based on variable generation and maneuvered nuclear generation.
13 Directionally, if there were no exports, the quantities of SBG would significantly increase, up to
14 the additional production from variable generation and the remaining capacity from nuclear
15 resources. The IESO would also expect much more frequent reliability issues such as nuclear unit
16 shutdowns if no exports were available during these times. This exercise would require the IESO
17 to assume that Ontario has no export capability and is essentially operating as an island. In that
18 hypothetical scenario, Ontario would have invested in a very different supply mix, which would
19 lead to different SBG outcomes.

Reference: The IESO's 2021 Annual Planning Outlook & 2012 CRA Study

Undertaking: IESO to respond to Mr. Rubenstein's question about change in supply conditions over the next 10 years as compared to those considered in the 2012 CRA Study.

Response:

As discussed in the IESO's Annual Planning Outlook (APO) the future supply mix is uncertain, with recognition that there is a potential for considerable change in the 2020s and into the 2030s. However, based on recent history and the nature of Ontario's supply mix, CRA's 2013 and 2015 model years are more representative of near-term supply conditions.

UNDERTAKING JT-1.11

Reference: Exhibit I-01-34 – OEB Staff Interrogatory 34

Undertaking: The IESO to provide its view with references to appropriate historical documentation as to the purpose of the ICP mechanism.

Response:

As stated in response to OEB Staff Interrogatory 34 b), it is the IESO's view that the purpose of the ICP mechanism was, and remains, to allocate access to interties through the use of a dynamic pricing mechanism that automatically adjusts to changing market conditions and to utilize any surplus generated by that mechanism to offset costs for Ontario consumers. The IESO achieves this purpose by disbursing any surplus in the Transmission Rights Clearing Account (TRCA) to Ontario consumers as detailed in response to JT-1.3.

The purpose of the ICP, its relationship to the ETS, and the evolution of the TRCA disbursement methodology can be traced through a number of historical documents including:

- Sections 3.3, 4.5 and 4.6 of the Final Report of the Market Design Committee (MDC) dated January 29, 1999 outlined a framework and rationale that would become the basis of the ICP, the TR market and exporter's responsibility for uplift charges. The Final Report is filed as Attachment 1 to this undertaking. The Committee noted at page 4-11 that "this congestion pricing approach will encourage the efficient use of the interties and will provide useful price signals to market participants regarding the relative merits of alternative investments in generation on either side of the constrained interties or transmission upgrades to expand the intertie capabilities." As part of Recommendation 4-11, the Committee recommended that "[n]et auction revenues [from the TR market] should be used to offset revenue requirements for Basic Use Service."
- The OEB approved the establishment of the ETS at a rate of \$1/MWh in its decision dated May 26, 2000 in RP-1999-044.¹ In making that decision, the OEB reviewed the nascent congestion pricing and transmission rights regimes. With respect to those regimes, the OEB stated its "general expectation that, under the Market Rules, the congestion management system of the IMO will yield some net revenue that will be credited to transmission customers (market participants)." The OEB settled on a \$1/MWh flat rate

¹ <https://www.oeb.ca/documents/cases/RP-1999-0044/dec.pdf>

- 1 because it was not possible at that time to assess whether “net revenue arising from the
2 congestion management will be greater or less than the revenue from the \$1/MWh flat
3 rate”.
- 4 • The basic structure of the congestion pricing regime recommended by the MDC was
5 implemented in the Market Rules, including the intention that net revenues would be
6 used to offset transmission service charges. In particular, section 4.18.2 of Chapter 8 of
7 the Market Rules (which has been in place since Market opening) provided the IESO board
8 with the discretion to disburse surplus funds from the TRCA “for the purpose of using
9 those funds to offset *transmission services charges*.”
 - 10 • The OEB’s Market Surveillance Panel (MSP) reviewed congestion pricing and the TRCA in
11 its January 2013 report that covered the November 2011 to April 2012 period.² The MSP
12 recommended a number of changes to the IESO’s handling of the TRCA, including in
13 section 4.2.6 of the report a recommendation that the IESO authorize annual
14 disbursements of any surplus in the TRCA.
 - 15 • In its decision dated June 6, 2013 in EB-2012-0031, the OEB noted at page 6 that “[t]here
16 was disagreement amongst the experts, and amongst the parties, as to how the allocation
17 of the producer surplus and [revenue from the ICP] should be viewed. The allocation of
18 these amounts to Ontario consumers, either directly or indirectly, impacts which ETS rate
19 option appears to provide the greatest benefit.” In particular, there was a disagreement
20 as to whether the benefits of the ICP revenue flowed “completely to Ontario consumers”
21 or if “some of the [ICP revenue] would likely flow to traders.” The OEB noted that the IESO
22 was undertaking a review of the distribution of revenue received from the ICP at that
23 time.
 - 24 • As described in page 12 of the IESO’s ETS Rate Submission, the IESO undertook the
25 Transmission Rights Review in 2013-2014 in response to the MSP’s recommendations and
26 implemented changes which resulted in significantly higher amounts of intertie
27 congestion funds being available for disbursement to domestic consumers and exporters
28 from the TRCA on a semi-annual basis.
 - 29 • The MSP reviewed the methodology utilized to disburse any surplus from the TRCA in its
30 May 2017 report that covered the November 2015 to April 2016 period.³ When discussing
31 the purpose of congestion rents, the MSP noted that “[a]ny congestion rent collected by
32 the IESO and paid to transmission owners would go to offset the revenue requirement of
33 those companies, thus reducing the regulated rates charged to their transmission
34 customers. It follows that, in Ontario, transmission customers benefit from congestion
35 rent.” The MSP recommended that the IESO modify its historic practice of allocating the
36 TRCA surplus on a volumetric basis to an allocation based on proportion of transmission
37 service charges paid by Ontario consumers and exporters respectively.

² https://www.oeb.ca/oeb/Documents/MSP/MSP_Report_Nov2011-Apr2012_20130114.pdf

³ https://www.oeb.ca/sites/default/files/msp-report-nov2015-apr2016_20170508.pdf

- 1 • In response to the MSP recommendations, the IESO undertook a review of the TRCA
2 disbursement methodology as described at page 12 of the IESO's ETS Rate Submission,
3 including the retention of the Brattle Group to prepare the report identified in response
4 to Undertaking JT-1.6. The Brattle Group reviewed the options available for the
5 disbursement of TRCA surpluses, including providing surplus TRCA funds to transmission
6 operators to offset transmission charges (see page 18 of the report). The Brattle Group
7 noted that there was no process to adjust the Uniform Transmission Rate to account for
8 surplus TRCA funds, this objective could be met by the direct transfer of funds to
9 transmission customers (internal load and exporters) to lower their cost of using the
10 transmission system.
- 11 • The IESO adopted the MSP's recommendation to allocate TRCA surplus disbursements
12 based on proportion of transmission service charges paid effective June 2021 and made
13 the requisite changes to the Market Rules. Under the revised disbursement methodology,
14 approximately 98% of any surplus disbursed from the TRCA now flows to Ontario
15 consumers either directly or through the consumer's local distribution company.

16
17 As shown in Table 5 of Attachment 1 to OEB Staff Interrogatory 1, the TRCA disbursement to
18 Ontario loads substantially exceeded the amount of revenue collected from the ETS between
19 2017 and 2021. In May 2022, the IESO made a semi-annual TRCA disbursement of \$70.8 million
20 for the prior 6-month period.

1
2
3 **Reference:** No reference provided.
4
5

6 **Undertaking:** IESO to respond to Mr. Pattani's question about meeting area requirements
7 in a particular load area, limited up to the point of reducing export capability.
8

9 **Response:**

10 To approach this question, a distinction is required between local area, or regional planning, and
11 bulk system planning. Generally, in conducting local area planning, now commonly referred to in
12 Ontario as regional planning, consideration of imports and exports is typically not within the scope
13 of the local planning studies. However, when assessing the bulk supply in a given portion of the
14 system, imports and exports are taken into account.
15

16 Section 3.2 of the Ontario Resource and Transmission Assessment Criteria¹ (ORTAC) outlines how
17 imports and exports should be considered when stressing the system being studied, in order to
18 determine the transfer capability of relevant transmission interfaces. It specifies that for all-in-
19 service conditions, the effect of bilateral assistance on the tie-line should be studied. However,
20 section 3.2 on its own does not stipulate that the transmission system needs to be planned (i.e.,
21 that recommendations need to be made) to maintain existing capabilities – the need for
22 maintaining the intertie capability is tied to the resulting reliability, economic, operational and
23 resiliency benefits, and the cost of the reinforcement option(s) and the alternatives being
24 contemplated.
