### 3-1-1 LOAD FORECAST

#### 1. INTRODUCTION

This Exhibit presents details of InnPower Corporation’s (“InnPower”) historical operating revenue from its last Cost of Service (“COS”) in 2017 (EB-2016-0085) up to the end of 2022, as well as presenting forecast operating revenues for the 2023 Bridge and 2024 Test Years. The Exhibit goes on to explain the approach to forecasting load and customer/connection growth for the 2023 and 2024 Test Years, consistent with the approach taken by InnPower in its 2017 COS. Finally, the Exhibit provides an Accuracy of Load Forecast and Variance Analysis, which assesses year-over-year variances in revenues, customers/connections, and load from 2017 through the 2024 Test Year.

InnPower is proposing a total Service Revenue Requirement of \$16,216,303, which is inclusive of \$1,683,551 in Other Revenue and a Base Revenue Requirement of \$14,532,752. The following Table 3-1 summarizes InnPower’s total operating revenue, drawing data from InnPower’s audited financial statements. The 2024 Test Year is presented both at current approved rates for 2023, and at proposed rates for 2024.

**Table 3-1: Summary of Operating Revenue**

Distribution Throughput Revenue	2017 Board Approved	2017 Actual	2018 Actual	2019 Actual	2020 Actual	2021 Actual	2022 Actual	2023 Bridge	2024 Test at Current Rates	2024 Test at Proposed Rates
Residential	8,064,052	7,367,770	8,572,644	9,054,177	9,411,642	9,991,023	10,538,053	11,173,664	11,526,164	11,867,968

1   **2.       SUMMARY OF LOAD AND CUSTOMER/CONNECTION FORECAST**

2

3   **2.1       Load and Revenue Forecasts**

4   The purpose of this evidence is to present the process used by InnPower to prepare the weather  
5   normalized load and customer/connection forecast used to design the proposed 2024 Test Year  
6   distribution rates.

7

8   InnPower has filed the 2024 Load Forecast as Appendix 3-1-1 (A) and the 2024 Demand Data  
9   Model as Appendix 3-1-1 (D).

10

11   In summary, InnPower used the same regression analysis methodology approved by the Ontario  
12   Energy Board (the “OEB” or “Board”) in InnPower’s 2017 COS application. The regression  
13   analysis has been updated to include actual data to the end of 2022 and uses the same variables  
14   as those in InnPower’s 2017 COS application.

15

16   With regards to the overall process of load forecasting InnPower is of the view that conducting a  
17   regression analysis on historical electricity purchases to produce an equation that will predict  
18   purchases is appropriate. InnPower has data regarding the amount of electricity (in kWh)  
19   purchased from the IESO for use by its customers. Utilizing a regression analysis, these  
20   purchases can be related to other monthly explanatory variables, producing an equation that  
21   predicts the purchases based on the explanatory variables. This prediction model is then used as  
22   the basis to forecast the total level of weather normalized purchases for the Bridge and Test Years,  
23   which is converted to billed kWh by rate class. A detailed explanation of this process is provided  
24   in this evidence.

25

26   Based on the OEB's approval of this methodology in InnPower’s last COS application, in addition  
27   to the OEB’s approval of this same method in recent COS applications of other applicants,  
28   InnPower submits the load forecasting methodology is reasonable for the purposes of this  
29   Application. The following materials support the weather normalized load forecast used by  
30   InnPower in this Application.

31

- 1 Table 3-2, Table 3-3 and Table 3-4 below provide a summary of the weather normalized load and
- 2 customer/connection forecast used in this Application. This is also filed in Appendix 3-1-1 (B)
- 3 OEB Appendix 2-IB.
- 4

1 **Table 3-2: Summary of Load and Customer/Connection Forecast**

Year	Billed Actual (GWh)	Growth (GWh)	Billed Weather Normal (GWh)	Growth (GWh)	Customer/Connection Count	Growth
<b>Billed Energy (GWh) and Customer Count / Connections</b>						
2017 Board Approved	242.6				19,906	
2013	234.0		236.1		18,286	
2014	236.1	2.1	237.7	1.6	18,736	450
2015	239.4	3.3	241.2	3.5	19,073	337
2016	243.1	3.7	239.0	(2.2)	19,398	325
2017	242.3	(0.8)	247.1	8.1	19,957	559
2018	263.5	21.2	257.8	10.7	20,996	1039
2019	270.1	6.6	270.4	12.5	22,042	1045
2020	275.9	5.8	274.1	3.8	22,460	418
2021	278.4	2.5	280.3	6.2	23,343	883
2022	283.5	5.2	282.6	2.3	24,316	974
2023 Bridge	288.2	4.7	288.2	5.6	25,102	786
2024 Test	295.1	6.9	295.1	6.9	25,914	812

2  
 3 In the above Table 3-2, the billed GWh data from 2013 to 2022 reflects actual weather and weather  
 4 normal conditions in each year. The weather normal values are the actual values adjusted by the  
 5 weather normal conversion factor outlined in Table 3-6. The weather conversion factor is  
 6 determined consistent with the approach outlined by the OEB in Appendix 2-IA. For 2023 and  
 7 2024, the forecasted billed GWh is presented on a weather normal basis.

8  
 9 Customer/Connection values are presented on an average basis throughout this evidence for the  
 10 purpose of rate design, and sentinel lights, street lights and unmetered loads are measured as  
 11 connections.

1 Table 3-3 provides the historical billed amounts on an actual and weather normalized basis by  
 2 rate class using the weather normal conversion factor from Table 3-6. The forecasted billed  
 3 amounts for 2023 and 2024 are also provided by rate class.

4  
 5

**Table 3-3: Billed Energy by Rate Class**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor	Total

1  
 2 **2.2 Forecast Methodology – Multivariate Regression Model**  
 3 InnPower’s weather normalized load forecast is developed through a three-step process. First, a  
 4 total system weather normalized purchased energy forecast is developed based on a multivariate  
 5 regression model that incorporates historical load, weather, and other variables that impact  
 6 electricity usage. Second, the weather normalized purchased energy forecast is adjusted by a  
 7 historical loss factor to produce a weather normalized billed energy forecast. Finally, the forecast  
 8 of billed energy by rate class is developed based on a forecast of customer/connections numbers

1 and the 2022 usage patterns per customer/connection. For the rate classes that have weather  
2 sensitive load their forecasted billed energy is adjusted to ensure that the total billed energy  
3 forecast by rate class is equivalent to the total weather normalized billed energy forecast that has  
4 been determined from the regression analysis. The forecast of customers by rate class is  
5 determined using a geometric mean analysis. For those rate classes that use kW for the  
6 distribution volumetric billing determinant, an adjustment factor is applied to the class energy  
7 forecast based on the historical relationship between kW and kWh. The following will explain the  
8 forecasting process in more detail.

9

### 10 **2.3 Purchased kWh Load Forecast**

11 An equation to predict total system purchased energy is developed using a multivariate regression  
12 model with the independent variables outlined below. The regression model uses monthly kWh  
13 and monthly values of independent variables from January 2013 to December 2022 to determine  
14 the monthly regression coefficients.

15

16 With regards to weather normalization, InnPower submits that it is appropriate to review the  
17 impact of weather over the past ten years, January 2013 to December 2022, since it is consistent  
18 with a time period outlined in the filing requirements and it is reflective of recent weather  
19 conditions. The average weather conditions over this period are applied in the prediction formula  
20 to determine a weather normalized forecast for 2024.

21

22 Consistent with InnPower's 2017 COS, the multivariate regression model has determined the  
23 drivers of year-over-year changes in InnPower's load growth are: weather (heating and cooling  
24 degree days), days in month, spring/fall flag<sup>1</sup>, and the number of customers in the Residential,  
25 GS <50kW, GS 50 to 4,999kW and Embedded Distributor rate classes. These factors are  
26 captured within the regression model. InnPower did not include a variable for Conservation and  
27 Demand Management (CDM), nor were any explicit CDM adjustments made to the forecast.

28

---

<sup>1</sup> A variable which identifies spring or fall months in a calendar year and helps to capture energy use impacted by these seasons

1 The following outlines the predication model used by InnPower to predict weather normal  
2 purchases for the 2024 Test Year.

3 InnPower Monthly Predicted kWh Purchases:

- 4
- 5 = Heating Degree Days \* 12,782
  - 6 + Cooling Degree Days \* 47,513
  - 7 + Number of Days in the Month \* 631,822
  - 8 + Spring/Fall Flag \* (639,386)
  - 9 + Number of Customers<sup>2</sup> \* 858
  - 10 + Constant of (16,791,617)
- 11

12 The monthly data used in the regression model and the resulting monthly prediction for the actual  
13 and forecasted years are provided in Appendix 3-1-1 (C).

14

15 The sources of historical data from 2013 through 2022 for the various data points are:

- 16
- 17 a) Environment Canada website for monthly heating degree day and cooling degree  
18 information. Weather data was obtained from the Toronto Pearson International Airport. 18°C  
19 is the base temperature from which heating degree days and cooling degree days are  
20 calculated.
  - 21 b) Calendar-based number of days in the month and identification of the spring/fall flag.
  - 22 c) The number of customers in the Residential, GS <50kW, GS 50 to 4,999kW, and Embedded  
23 Distributor rate classes is based on average annual historical actuals from 2013 to 2022.
- 24

25 The prediction formula has the following statistical results which generally indicate the formula  
26 has a very good fit to the actual data set.

---

<sup>2</sup> In Residential, GS <50kW, GS 50 to 4,999kW and Embedded Distributor rate classes

1

**Table 3-5: Statistical Results**

R Square	96.7%
Adjusted R Square	96.5%
F Test	658
MAPE (Monthly)	1.9%
<b>T-stats by Coefficient</b>	
Heating Degree Days	(8.2)
Cooling Degree Days	38.6
Days in Month	27.3
Spring Fall Flag	9.6
Number of Customers	27.7
Constant	(8.2)

2

3 The annual results of the above prediction formula compared to the actual annual purchases from  
4 2013 to 2022 are shown below in Table 3-6, along with the predicted total system purchases for  
5 InnPower for 2023 and 2024 on a weather normal basis. Information is also provided to show the  
6 Weather Normal Conversion Factor which is used to weather normalize actual 2013 to 2022  
7 volume data. In Table 3-6, the Predicted Weather Normal values are similar to the Predicted  
8 amounts, but the weather normalized heating degree days and cooling degree days used to  
9 determine the weather normal forecast for 2023 and 2024 are used in the prediction formula in  
10 place of actual heating degree days and cooling degree days. The ratio of Predicted Weather  
11 Normal to Predicted values results in a Weather Normal Conversion Factor. This factor is applied  
12 to the Actual amount which results in the Actual Weather Normal value.

1 **Table 3-6: Total System Purchases Including Wholesale Market Participants**

Year	Actual	Predicted	% Difference	Predicted Weather Normal	Weather Normal Conversion Factor	Actual Weather Normal
<b>Purchased Energy (GWh)</b>						
2013	251.8	246.9	(1.9%)	249.1	1.0089	254.0
2014	253.3	251.3	(0.8%)	253.0	1.0068	255.0
2015	255.8	254.9	(0.4%)	256.7	1.0074	257.7
2016	259.4	265.5	2.4%	261.1	0.9832	255.0
2017	256.8	259.9	1.2%	265.1	1.0199	261.9
2018	278.8	280.6	0.6%	274.5	0.9785	272.8
2019	280.6	282.9	0.8%	283.2	1.0010	280.9
2020	291.4	288.9	(0.9%)	287.1	0.9936	289.6
2021	295.2	291.7	(1.2%)	293.7	1.0070	297.3
2022	299.9	300.4	0.1%	299.4	0.9968	299.0
2023 Bridge		305.9		305.9	1.0000	
2024 Test		313.3		313.3	1.0000	

2  
 3 The weather normalized amount for 2024 is determined by using 2024 dependent variables in the  
 4 prediction formula on a monthly basis along with the average monthly heating degree days and  
 5 cooling degree days which have occurred from January 2013 to December 2022 (i.e., 10 years).

6  
 7 **2.4 Billed kWh Load Forecast**

8 To determine the total weather normalized energy billed forecast, the total system weather  
 9 normalized purchases forecast is adjusted by a historical loss factor. The historical loss factor  
 10 used is 6.16% which represents the average loss factor from 2013 to 2022. With this average loss  
 11 factor the total weather normalized billed energy before adjustment discussed below will be 288.2  
 12 (GWh) for 2023 (i.e., 305.9/1.0616) and 295.1 (GWh) for 2024 (i.e., 313.3/1.0616).

1 **2.5 Billed kWh Load Forecast and Customer/Connection Forecast by Rate Class**

2 Once the total weather normalized billed energy amount is known, this amount needs to be  
 3 distributed by rate class for rate design purposes taking into consideration the  
 4 customer/connection forecast and expected usage per customer by rate class.

5  
 6 The next step in the forecasting process is to determine a customer/connection forecast. The  
 7 customer/connection forecast is based on reviewing historical customer/connection data that is  
 8 available as shown in the following Table 3-7.

9  
 10 **Table 3-7: Historical Customers/Connections (Average)**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor	Total
<b>Number of Customers/Connections</b>								
2013	14,181	949	66	168	2,843	78	1	18,286
2014	14,509	991	66	169	2,923	76	1	18,736
2015	14,862	1,001	71	166	2,898	76	1	19,073
2016	15,202	1,016	75	166	2,863	75	1	19,398
2017	15,632	1,030	86	162	2,973	74	1	19,957
2018	16,491	1,082	90	162	3,097	74	1	20,996
2019	17,294	1,121	84	160	3,307	75	1	22,042
2020	17,583	1,154	79	155	3,414	73	1	22,460
2021	18,253	1,191	77	153	3,597	71	1	23,343
2022	18,755	1,246	77	151	4,014	72	1	24,316

11  
 12 From the historical customer/connection data the growth rate in customers/connections can be  
 13 evaluated, which is provided in Table 3-8.

1

**Table 3-8: Growth Rate in Customer/Connections**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor
<b>Growth Rate in Customers/Connections</b>							
2013							
2014	2.3%	4.4%	0.3%	0.8%	2.8%	(2.6%)	0.0%
2015	2.4%	0.9%	6.5%	(2.2%)	(0.9%)	0.6%	0.0%
2016	2.3%	1.6%	5.8%	0.2%	(1.2%)	(0.9%)	0.0%
2017	2.8%	1.4%	14.9%	(2.6%)	3.8%	(2.4%)	0.0%
2018	5.5%	5.0%	5.1%	(0.2%)	4.2%	0.7%	0.0%
2019	4.9%	3.6%	(6.6%)	(1.0%)	6.8%	0.7%	0.0%
2020	1.7%	2.9%	(5.9%)	(3.0%)	3.3%	(1.8%)	0.0%
2021	3.8%	3.2%	(3.0%)	(1.5%)	5.3%	(3.0%)	0.0%
2022	2.7%	4.6%	0.7%	(1.4%)	11.6%	2.0%	0.0%
<b>Geometric Mean</b>	<b>3.2%</b>	<b>3.1%</b>	<b>1.8%</b>	<b>(1.2%)</b>	<b>3.9%</b>	<b>(0.8%)</b>	<b>0.0%</b>

2

3

4 The growth factor resulting from the geometric mean analysis from 2013 to 2022 is applied to the  
 5 2022 customer numbers to determine the forecast of customer/connections for 2023. The factor  
 6 is then applied again to the 2023 forecast to determine the 2024 forecast. Table 3-9 outlines the  
 7 forecast of customers/connections by rate class for the 2023 Bridge Year and 2024 Test Year.

1 **Table 3-9: Customer/Connection Forecast**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor	Total
<b>Forecast Number of Customers/Connections</b>								
2023 Bridge	19,346	1,284	79	149	4,171	72	1	25,102
2024 Test	19,957	1,324	80	147	4,334	71	1	25,914

2 The next step in the process is to review the historical customer/connection usage and to reflect  
 3 this usage per customer in the forecast. Table 3-10 below provides the average annual usage per  
 4 customer by rate class for 2022.

5

6 **Table 3-10: 2022 Actual Annual Usage per Customer**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor
<b>Annual kWh Usage Per Customer/Connection</b>							
2022	9,696	35,271	717,773	648	201	6,185	935,589

7

8 The 2023 and 2024 forecast of usage per customer/connection have been held constant at the  
 9 2022 level since the usage per customer/connection has generally been declining in most rate  
 10 classes since 2013. The resulting usage forecast is as follows in Table 3-11.

1 **Table 3-11: Forecast Annual kWh Usage per Customer/Connection**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor
<b>Forecast Annual kWh Usage per Customers/Connection</b>							
2023 Bridge	9,696	35,271	717,773	648	201	6,185	935,589
2024 Test	9,696	35,271	717,773	648	201	6,185	935,589

2  
 3 The preceding information is used to determine the non-normalized weather billed energy forecast  
 4 by applying the forecast number of customer/connection from Table 3-9 by the forecast of annual  
 5 usage per customer/connection from Table 3-11. The resulting non-normalized weather billed  
 6 energy forecast is shown in the following Table 3-12.

7  
 8 **Table 3-12: Non-Normalized Weather Billed Energy Forecast**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor	Total
<b>NON-normalized Weather Billed Energy Forecast (GWh)</b>								
2023 Bridge	187.6	45.3	56.4	0.1	0.8	0.4	0.9	291.6
2024 Test	193.5	46.7	57.4	0.1	0.9	0.4	0.9	300.0

9  
 10 The non-normalized weather billed energy forecast has been determined, but this needs to be  
 11 adjusted in order to be aligned with the total weather normalized billed energy forecast mentioned  
 12 above of 288.2 (GWh) for 2023 and 295.1 (GWh) for 2024.

13  
 14 The difference between the non-normalized and normalized forecast is assumed to be the  
 15 adjustment to move the forecast to a weather normal basis, and this amount will be assigned to  
 16 those rate classes that are weather sensitive. Based on the weather normalization work

1 completed by Hydro One for 2004 informing the original cost allocation informational study it was  
 2 determined that the weather sensitivity by rate classes is as presented in Table 3-13. The values  
 3 in the table are consistent with the rate class weather sensitivity percentages used in InnPower's  
 4 2017 COS application.

5  
 6

**Table 3-13: Weather Sensitivity by Rate Class**

Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor
<b>Weather Sensitivity</b>						
83%	83%	65%	0%	0%	0%	0%

7  
 8  
 9  
 10  
 11

The difference between the non-normalized and normalized forecast has been assigned on a pro rata basis to each rate class based on the above level of weather sensitivity. The following Table 3-14 outlines how the classes have been adjusted to align the non-normalized forecast with the normalized forecast.

1 **Table 3-14: Alignment of Non-normal to Weather Normal Forecast**

Year	Residential	General Service < 50 kW	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Unmetered Scattered Loads	Embedded Distributor	Total
<b>Non-normalized Weather Billed Energy Forecast (GWh)</b>								
2023 Bridge	187.6	45.3	56.4	0.1	0.8	0.4	0.9	291.6
2024 Test	193.5	46.7	57.4	0.1	0.9	0.4	0.9	300.0
<b>Weather Adjustment (GWh)</b>								
2023 Bridge	(2.3)	(0.6)	(0.6)	0.0	0.0	0.0	0.0	(3.4)
2024 Test	(3.3)	(0.8)	(0.8)	0.0	0.0	0.0	0.0	(4.8)
<b>Weather Normalized Billed Energy Forecast (GWh)</b>								
2023 Bridge	185.3	44.7	55.9	0.1	0.8	0.4	0.9	288.2
2024 Test	190.2	45.9	56.7	0.1	0.9	0.4	0.9	295.1

2

3 **2.6 Billed kW Load Forecast**

4 There are a number of InnPower customers/connections that are charged volumetric distribution  
 5 on a per kW basis.

6

7 For the GS 50 to 4,999 kW, Sentinel Lights, Street Lights and Embedded Distributor rate classes,  
 8 the energy forecast needs to be converted to a kW basis for rate setting purposes. To accomplish  
 9 this conversion, the 10-year average ratio of kW to kWh from 2013 through 2022 is applied to the  
 10 forecasted kWh to produce the required kW for 2023 and 2024.

11

12 The following Table 3-15 outlines the average ratio of kW to kWh for each rate class from 2013  
 13 through 2022.

1

**Table 3-15: 10-Year Average kW/KWh Ratio per Applicable Rate Class**

Year	General Service 50 to 4,999 kW	Sentinel Lights	Street Lights	Embedded Distributor
<b>Ratio of kW to kWh</b>				
2013	0.2832%	0.2720%	0.3029%	0.2549%
2014	0.2719%	0.2720%	0.3031%	0.2423%
2015	0.2653%	0.2646%	0.2840%	0.2525%
2016	0.2637%	0.2857%	0.3024%	0.2529%
2017	0.2625%	0.2778%	0.3054%	0.2481%

### 3-1-2 ACCURACY OF LOAD FORECAST AND VARIANCE ANALYSIS

The following discussion provides a year over year variance analysis of InnPower’s distribution revenue and billing determinants. The variance analysis compares 2017 Board Approved Proxy to 2017 Actual; 2017 Actual to 2018 Actual; 2018 Actual to 2019 Actual; 2019 Actual to 2020 Actual; 2020 Actual to 2021; 2021 Actual to 2022 Actual; 2022 Actual to 2023 Bridge Year and 2023 Bridge Year to 2024 Test Year. The overall variance analysis has been provided based on InnPower’s materiality of \$73,000; the materiality calculation being noted earlier in Exhibit 1 of this Application.

#### 2017 Board Approved to 2017 Actual

Table 3-18 compares distribution revenues for the 2017 Board Approved Proxy to 2017 Actuals. Table 3-19 compares the billing determinants (customers/connections and volumes).

2017 Actual Distribution revenue was \$887,482 lower than the 2017 Board Approved Proxy, principally due to InnPower’s 2017 rates ultimately not taking effect until January 1, 2018. With the exception of the Street Lights rate class, all customer classes experienced significant distribution revenue shortfalls relative to Board Approved distribution revenue. In contrast to distribution revenue variances, variances in billing determinants between 2017 Board Approved and 2017 Actual are minimal, with the exceptions being customer and volume shortfalls in the General Service 50 to 4,999kW class, and higher than forecast volumes in the Street Lights rate class.

**Table 3-18: Distribution Revenue – 2017 Board-Approved vs 2017 Actual**

Distribution Throughput Revenue	2017 Board Approved	2017 Actual	Difference (\$)	Difference (%)
Residential	8,064,052	7,367,770	(696,282)	-8.6%

 4 **2017 Actual to 2018 Actual**

5 Table 3-20 compares distribution revenues for 2017 Actuals against 2018 Actuals. Table 3-21  
 6 compares the billing determinants (customers/connections and volumes).

7  
 8 2018 Actual distribution revenue was \$10,688,697, or \$1,459,042 higher than 2017 Actuals,  
 9 principally explained by implementation of OEB-approved rates resulting from EB-2016-0085  
 10 effective January 1, 2018 and healthy customer growth. From 2017 to 2018 InnPower saw an  
 11 increase in total customers / connections of 1,039, or 5.2%. In addition, comparing the 2017 and  
 12 2018 variances between Actual and Weather Normalized in Table 3-21 suggests that weather was  
 13 also a contributing factor to the variance in distribution revenues between 2017 and 2018.

14  
 15 **Table 3-20: Distribution Revenue - 2017 Actual vs 2018 Actual**

3

**2018 Actual to 2019 Actual**

Table 3-22 compares distribution revenues for 2018 Actuals against 2019 Actuals. Table 3-23 compares the billing determinants (customers/connections and volumes).

7

2019 Actual distribution revenue was \$11,244,610 or \$555,913 higher than 2018 Actuals, principally explained by higher revenue in the residential and GS <50 kW customer classes. As seen in Tables 3-22 and 3-23, distribution revenue growth from 2018 to 2019 is closely aligned with growth in the number of residential customers and the growth in the total number of customers / connections; showing year over year increases of 4.9% and 5.0%, respectively.

2  
3  
4 **2019 Actual to 2020 Actual**

5 Table 3-24 compares distribution revenues for 2019 Actuals against 2020 Actuals. Table 3-25  
 6 compares the billing determinants (customers/connections and volumes).

7  
8 2020 Actual distribution revenue was \$11,612,614 or \$368,005 higher than 2019 Actuals, with  
 9 modest revenue growth in the Residential and GS <50kW classes balanced against reductions  
 10 to the revenues of GS 50 to 4,999kW and Unmetered Scattered Load classes. The onset of the  
 11 COVID-19 pandemic in 2020 is understood to have driven some of the trends seen in Table 3-25;  
 12 notably positive variances in total and average volumes in the Residential class, and negative  
 13 variances in total and average volumes in the GS <50kW and GS 50 to 4,999kW classes. Though  
 14 the pace of growth in customers / connections in the Residential and GS <50kW classes was  
 15 slowed in 2020 relative to past years, total customers still increased by 1.7% and 2.9%,  
 16 respectively. Paired with a standard IRM adjustment, InnPower saw modest growth in distribution  
 17 revenue in 2020 relative to 2019 Actuals.

1 **Table 3-24: Distribution Revenue - 2019 Actual vs 2020 Actual**

Distribution Throughput Revenue	2019 Actual	2020 Actual	Difference (\$)	Difference (%)

5  
6  
7 **2020 Actual to 2021 Actual**

8 Table 3-26 compares distribution revenues for 2020 Actuals against 2021 Actuals. Table 3-27  
 9 compares the billing determinants (customers/connections and volumes).

10  
11 2021 Actual distribution revenue was \$12,270,280 or \$657,666 higher than 2020 Actuals, marked  
 12 by a return to Residential customer additions more akin to those of 2018 and 2019 than 2020,  
 13 and modest increases in volumes across all rate classes save the Sentinel Lights, Unmetered  
 14 Scattered Load, and Embedded Distributor classes.<sup>1</sup> As seen in Table 3-27 comparing the year-  
 15 over-year variances between Actuals and Weather Normal, increased overall volumes were  
 16 muted by weather in 2021.

<sup>1</sup> InnPower’s proposed Embedded Distributor class did not exist as a separate rate class as of 2021, as it is a proposal included in this proceeding

1 **Table 3-26: Distribution Revenue - 2020 Actual vs 2021 Actual**

6  
7 **2021 Actual to 2022 Actual**

8 Table 3-28 compares distribution revenues for 2021 Actuals against 2022 Actuals. Table 3-29  
 9 compares the billing determinants (customers/connections and volumes).

10  
11 2022 Actual distribution revenue was \$12,969,113 or \$698,833 higher than 2021 Actuals, marked  
 12 by steady continued growth in the Residential customer class, and more notable customer growth  
 13 in the GS <50kW customer class. The GS <50kW class in particular saw noticeable increases in  
 14 volumes from 2021 to 2022, partially assisted by weather, and partially offset by a small decrease  
 15 in volumes in the GS 50 to 4,999kW rate class.

1 **Table 3-28: Distribution Revenue - 2021 Actual vs 2022 Actual**

6  
7 **2022 Actual to 2023 Bridge**

8 Table 3-30 compares distribution revenues for 2022 Actuals against the 2023 Bridge Year. Table  
 9 3-31 compares the billing determinants (customers/connections and volumes).

10  
 11 2023 Bridge distribution revenue is forecast to be \$13,701,411, or \$732,297 higher than 2022  
 12 Actuals. The customer / connections and load forecast methodology described above informs a  
 13 forecast which captures the continued healthy growth in the Residential and GS <50kW rate  
 14 classes, both in terms of customers and volumes, balanced against volume decreases in the GS  
 15 50 to 4,999kW, Sentinel Lights, Unmetered Scattered Load and Embedded Distributor rate  
 16 classes.

1 **Table 3-30: Distribution Revenue - 2022 Actual vs 2023 Bridge**

5  
6  
7 **2023 Bridge to 2024 Test**

8 Table 3-32 compares distribution revenues for the 2024 Test Year at existing 2023 rates against  
 9 the 2023 Bridge Year. Table 3-33 compares distribution revenues for the 2024 Test Year at  
 10 proposed rates against the 2023 Bridge Year. Table 3-34 compares the billing determinants  
 11 (customers/connections and volumes).

12  
 13 Table 3-32 illustrates the impact of billing determinant changes between the 2023 Bridge Year  
 14 and 2024 Test Year on distribution revenue, since distribution rates are held constant, while  
 15 Table 3-33 illustrates both changes in billing determinants and implementation of proposed 2024  
 16 rates. The proposed Embedded Distributor rate class is included in the presentation of 2024  
 17 distribution revenues, while in the 2023 Bridge Year this rate class is included within the GS 50  
 18 to 4,999kW rate class.
