My questions or concerns are. The gas that could come up from water wells, as we have too much in our water now. What's the fire control or prevention on these well sites? Like fire hydrants and foam. As these sites get bigger and pressures increase, what is the emergency proto call? Especially for the people living in the proximity of these areas. If there was a leak from one of these stations what is the safe distance from them? In the case of an extreme fire on a well or station how hot could it get, at what distance is considered to be safe? What is your compensation if one has to be evacuated from their home and anything do to with ones property if this was to happen?

Yours truly
Jake Smit
